Using the wide-angle UV emission detector, we conducted an [#experiment](#) 'UV Atmosphere'. It is aimed to get the atmosphere nocturnal glowing in the close UV wavelength.

This new experiment has its advantages: detector high light ratio and high time resolution (microseconds).

novitskiy\_iss • Segui

novitskiy\_iss • Приветствую, друзья! Сегодня вместе с Тома Пекоке подсчитали, что мой обидный налет равен 365 суткам. То есть ровно год в космосе за два полных полета и почти месяц третьего. Быстро время летит!

Наша работа продолжается и мы продолжаем работать! А как проводите вы эти длинные майские выходные, у кого какие планы? !!!

novitskiy\_iss • Знакомьтесь, это — широкоугольный детектор ультрафиолетового излучения ночной атмосферы. Этот телескоп предназначен для исследования кратковременных вспышек в земной атмосфере.

Целью эксперимента с одноименным названием #УФатмосфера является получение карты свечения ночной атмосферы в полосе длин волн ближнего ультрафиолета (300-400 нм) в пределах широт, доступных для наблюдения с орбиты полета Международной космической станции.

THE ASTROPHYSICAL JOURNAL, 745:161 (6pp), 2012 February 1

MUSCI ET AL.

**Figure 1.** Interstellar meteoroid flux estimates from various studies. The large star represents our result. Arrows indicate upper and lower limits. The data points from Meisel et al. (2002b) are for Geminga supernova particles assuming different models and fits. The AMOR data include the results from Baggaley et al. (1993), as well as the interpretation of those data from Taylor et al. (1996) and Baggaley (2000). The points from Weryk & Brown (2004) are for  $v_h > 2\sigma$  and  $v_h > 3\sigma$ , respectively, above the hyperbolic limit. The ranges at the top of the figure give the approximate sensitivity for different detectors. For comparison, the lines with different styles represent the mass distribution from several models and power-law fits. The slope from Mathis et al. (1977) is identical with the collisional cascade model (Dohnanyi 1969; Tanaka et al. 1996; Wyatt et al. 2007).

(A color version of this figure is available in the online journal.)

# Strange Quark matter

$Z=2$   $A=4$  (He)  
 $Z/A=0.5$

$Z=2$   $A=7$   
 $Z/A=0.286$

u,d,s quark matter  
might be stable

Not limited in A

$A=100, 1000, \dots$

Z is almost zero due to  
cancellation of quark  
charge

Could account for Dark  
Matter

Also candidate of  
UHECR

No Exotic Physics needed

# Conclusions

Mini-EUSO on ISS for three years  
(TODAY!)

It proves that it is possible – with larger  
detectors – to perform UHECR  
observation from space, with  
measurements according to simulations

First two pouches are back from space.  
Third expected in 2023 / launch of fourth

Godspeed, JEM-EUSO Program!
