

Some discussion points

- (More) questions regarding the previous talks;
- Alternative interferometric readouts which use computing (e.g. DFMI, fringe counters);
- Sensitivity curves: multiple/single and/or optimistic/realistic/pessimistic?
(difference between effect on GW science / lunar science)
- Will we show time lines? Optimistic/realistic/pessimistic? Useful given sometimes accelerated timelines because of sudden launch windows?
- Alternative technologies than the paths we are taking now? Mechanics/readout/cooling...?
- Synergy with Einstein Telescope and LISA technology development. Other projects?
- Anything else...?
