

# CUORE – Cryogenic Underground Observatory for Rare Events

On behalf of the **CUORE** collaboration

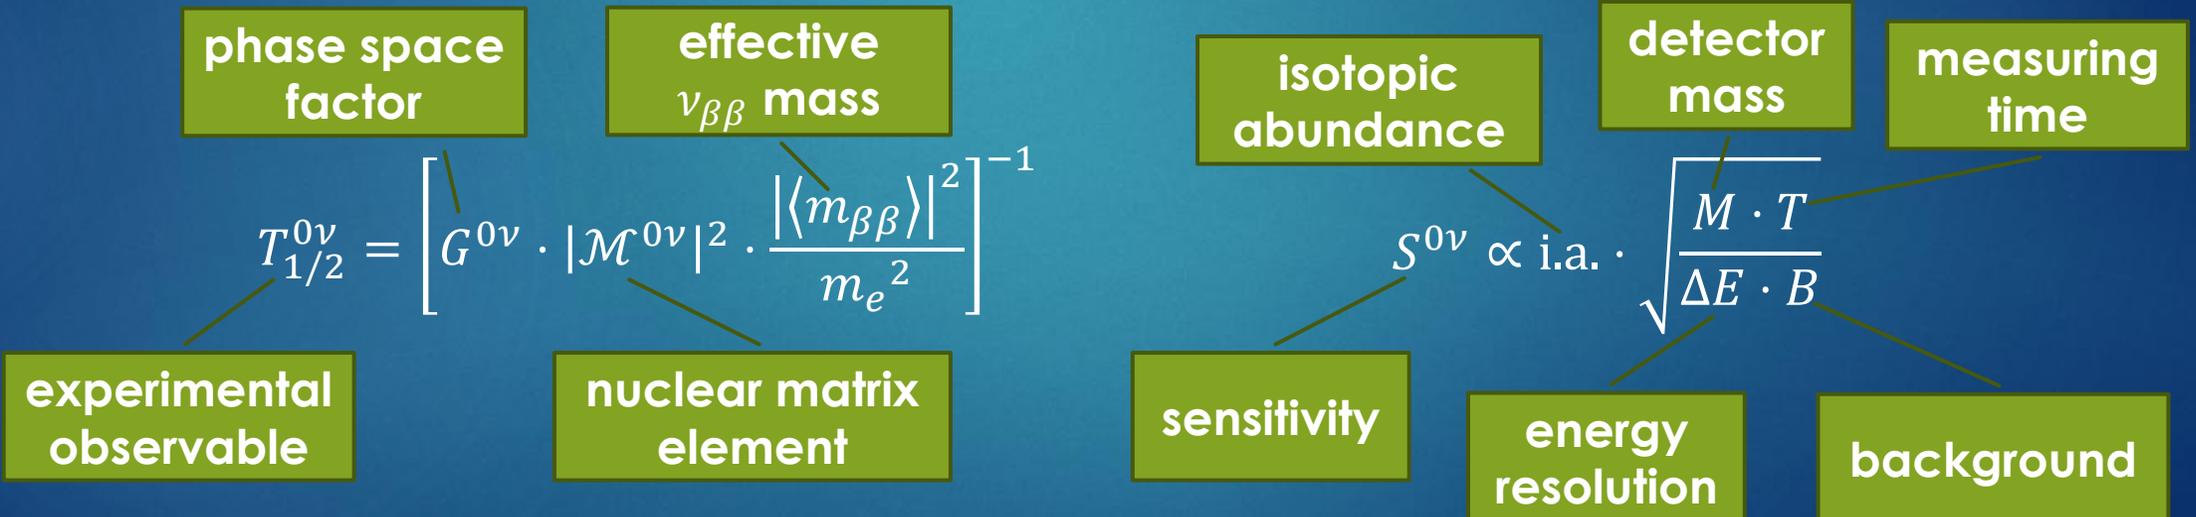

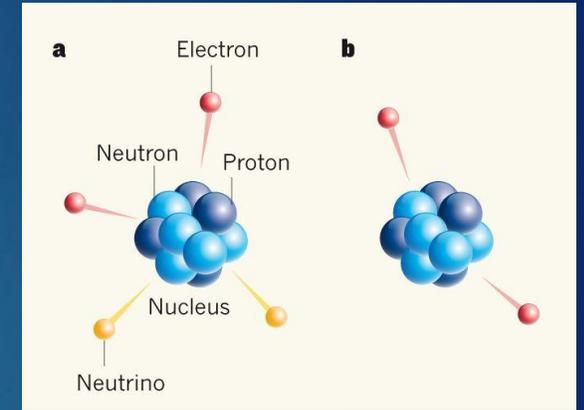

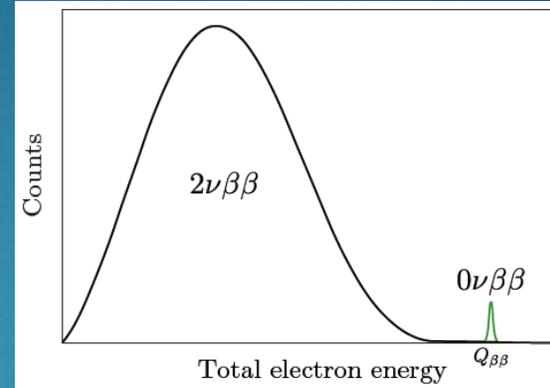

# Double Beta Decay ( $2\nu\beta\beta$ )

- ▶ Same mass number ( $A$ ), changes the nuclear charge ( $Z$ ) by two units.
- ▶ 2<sup>nd</sup> order weak transition, **allowed by the Standard Model.**
- ▶ Decay to the intermediate nucleus is forbidden.
- ▶ Only **even mass number nuclei.**
- ▶ Half-lives in the order of  $10^{18} \sim 10^{21}$  yr.
- ▶ Two-neutrino double beta decay ( $2\nu\beta\beta$ ) candidate isotopes:
  - ▶  $^{48}\text{Ca}$ ,  $^{76}\text{Ge}$ ,  $^{82}\text{Se}$ ,  $^{96}\text{Zr}$ ,  $^{100}\text{Mo}$ ,  $^{116}\text{Cd}$ ,  $^{124}\text{Sn}$ ,  
 $^{128}\text{Te}$ ,  $^{130}\text{Te}$ ,  $^{136}\text{Xe}$ ,  $^{150}\text{Nd}$

# Neutrinoless Double Beta Decay ( $0\nu\beta\beta$ )

- ▶ **Beyond Standard Model** process
- ▶ **Lepton Number Violation** ( $\Delta L = 2$ )
- ▶ Constraints on neutrino mass hierarchy and scale
- ▶ Hint on origin of matter/anti-matter asymmetry

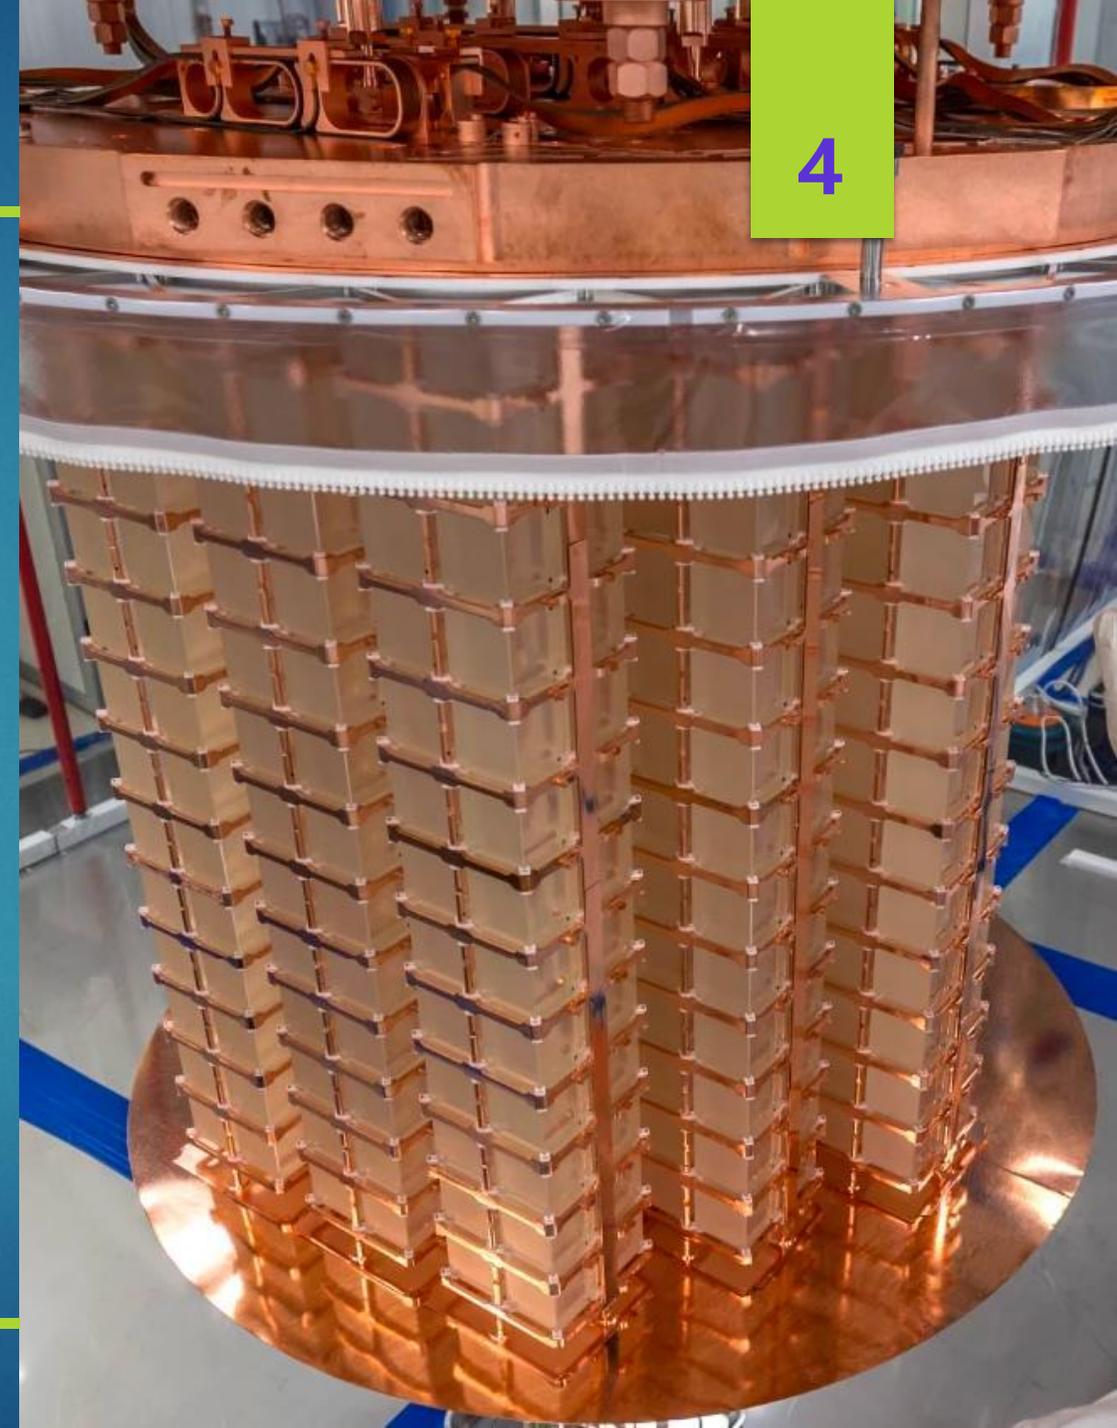

# CUORE experiment

- ▶ Cryogenic **U**nderground **O**bservatory for **R**are **E**vents
- ▶ In operation at the Laboratori Nazionali del Gran Sasso, Italy
- ▶ Main objective: observe  $0\nu\beta\beta$  in  $^{130}\text{Te}$
- ▶ The CUORE detector is hosted in a cryogen-free cryostat
  - ▶ Operating temperature  $\sim 10$  mK
  - ▶ Designed for low radioactivity and low vibrations environment
- ▶ Energy resolution: goal of 5 keV at  $Q_{\beta\beta}$  (2527.5 keV)
- ▶ Low background: goal of  $10^{-2}$  counts / (keV · kg · yr) at  $Q_{\beta\beta}$

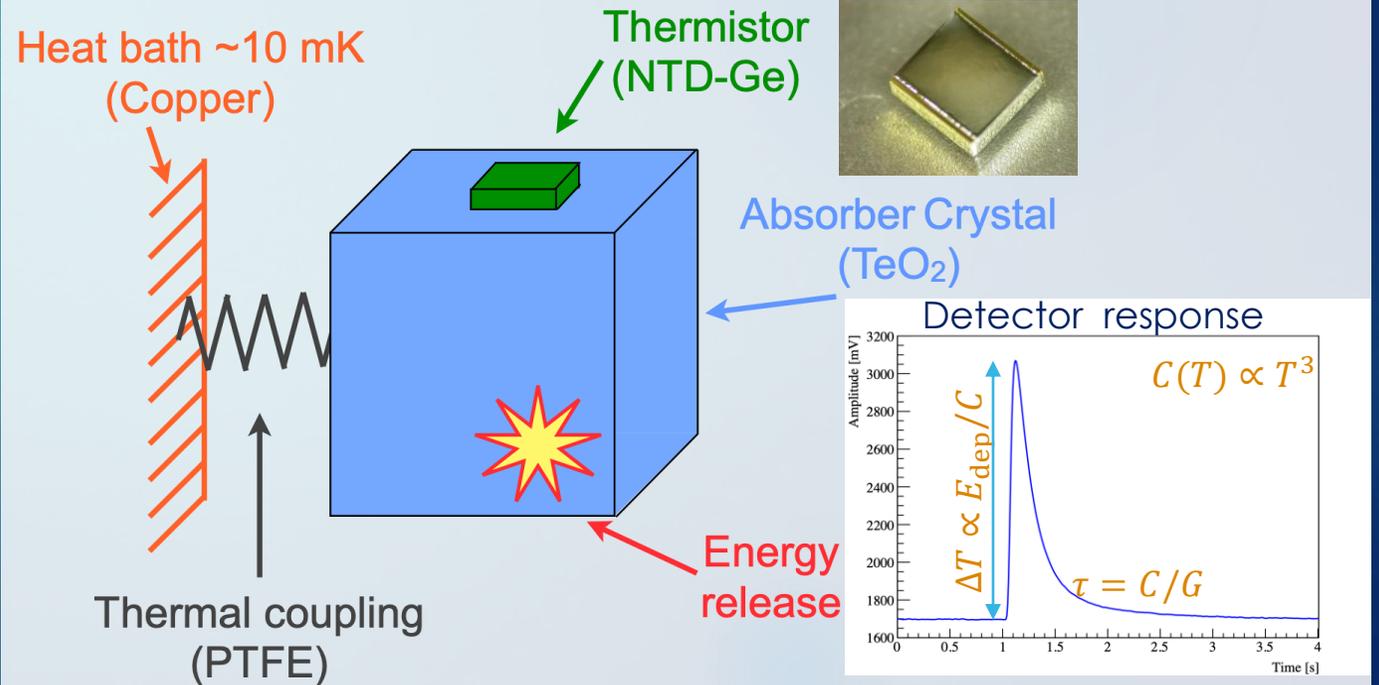

4

# Cryogenic Bolometer

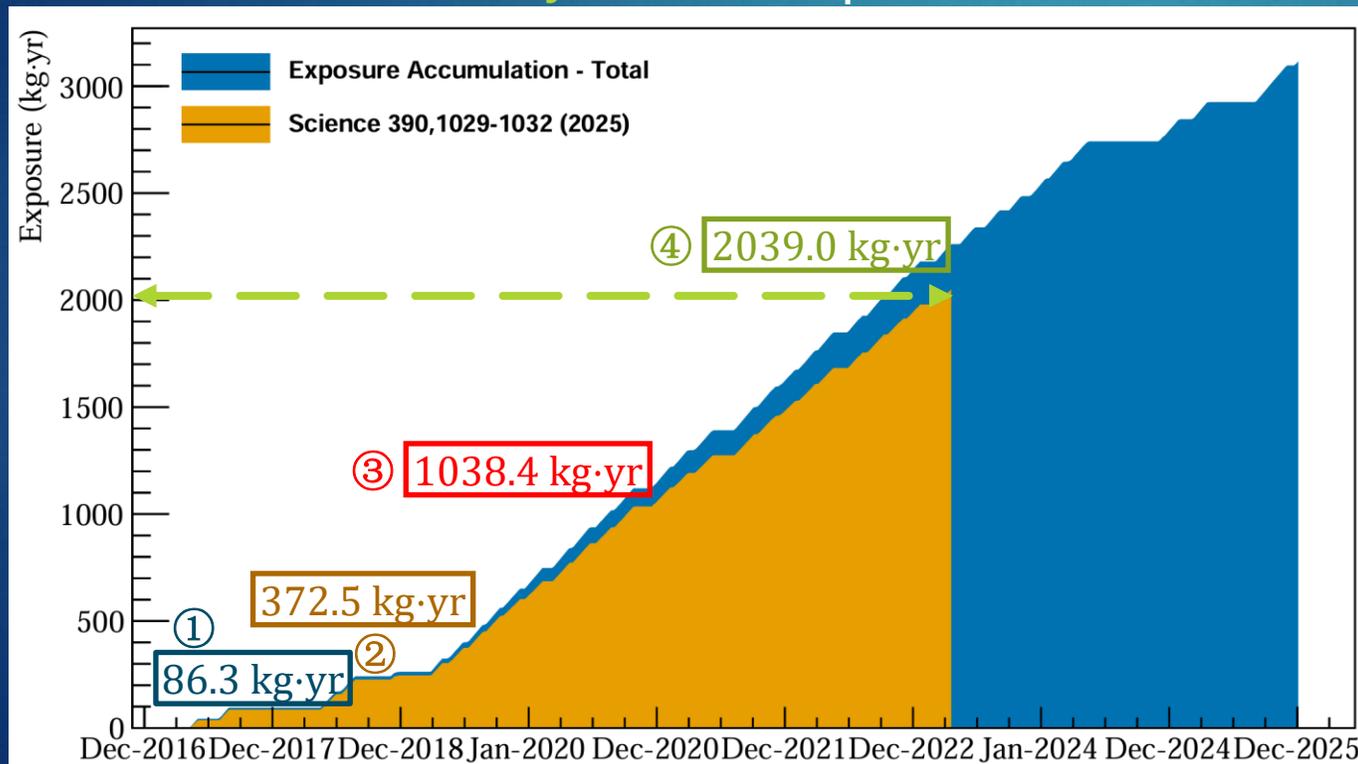

5

- ▶ Detector mass
- ▶ Energy resolution
- ▶ Bolometers must be operated at low temperatures.
- ▶ The thermal sensor is a **Neutron Transmutation Doped (NTD) Ge** thermistor, which is sensitive to temperature variation.
- ▶ Reproducibility
- ▶ Background level

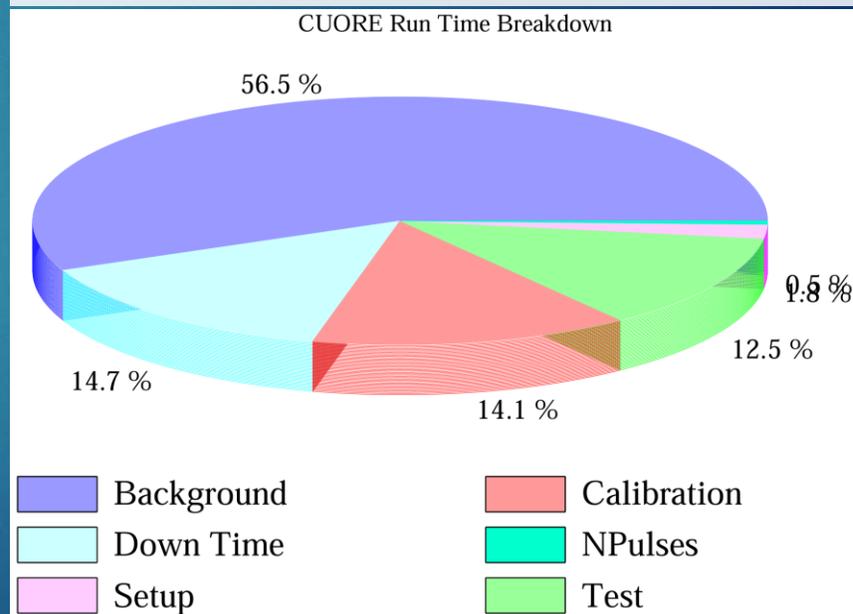

# Data collection

- ▶ Data taking started in 2017, with first 2 years for cryostat and detector optimization
- ▶ Stable data collection since 2019, with  $\geq 85\%$  uptime
- ▶ More than **3.1 ton·yr** of raw exposure accumulated

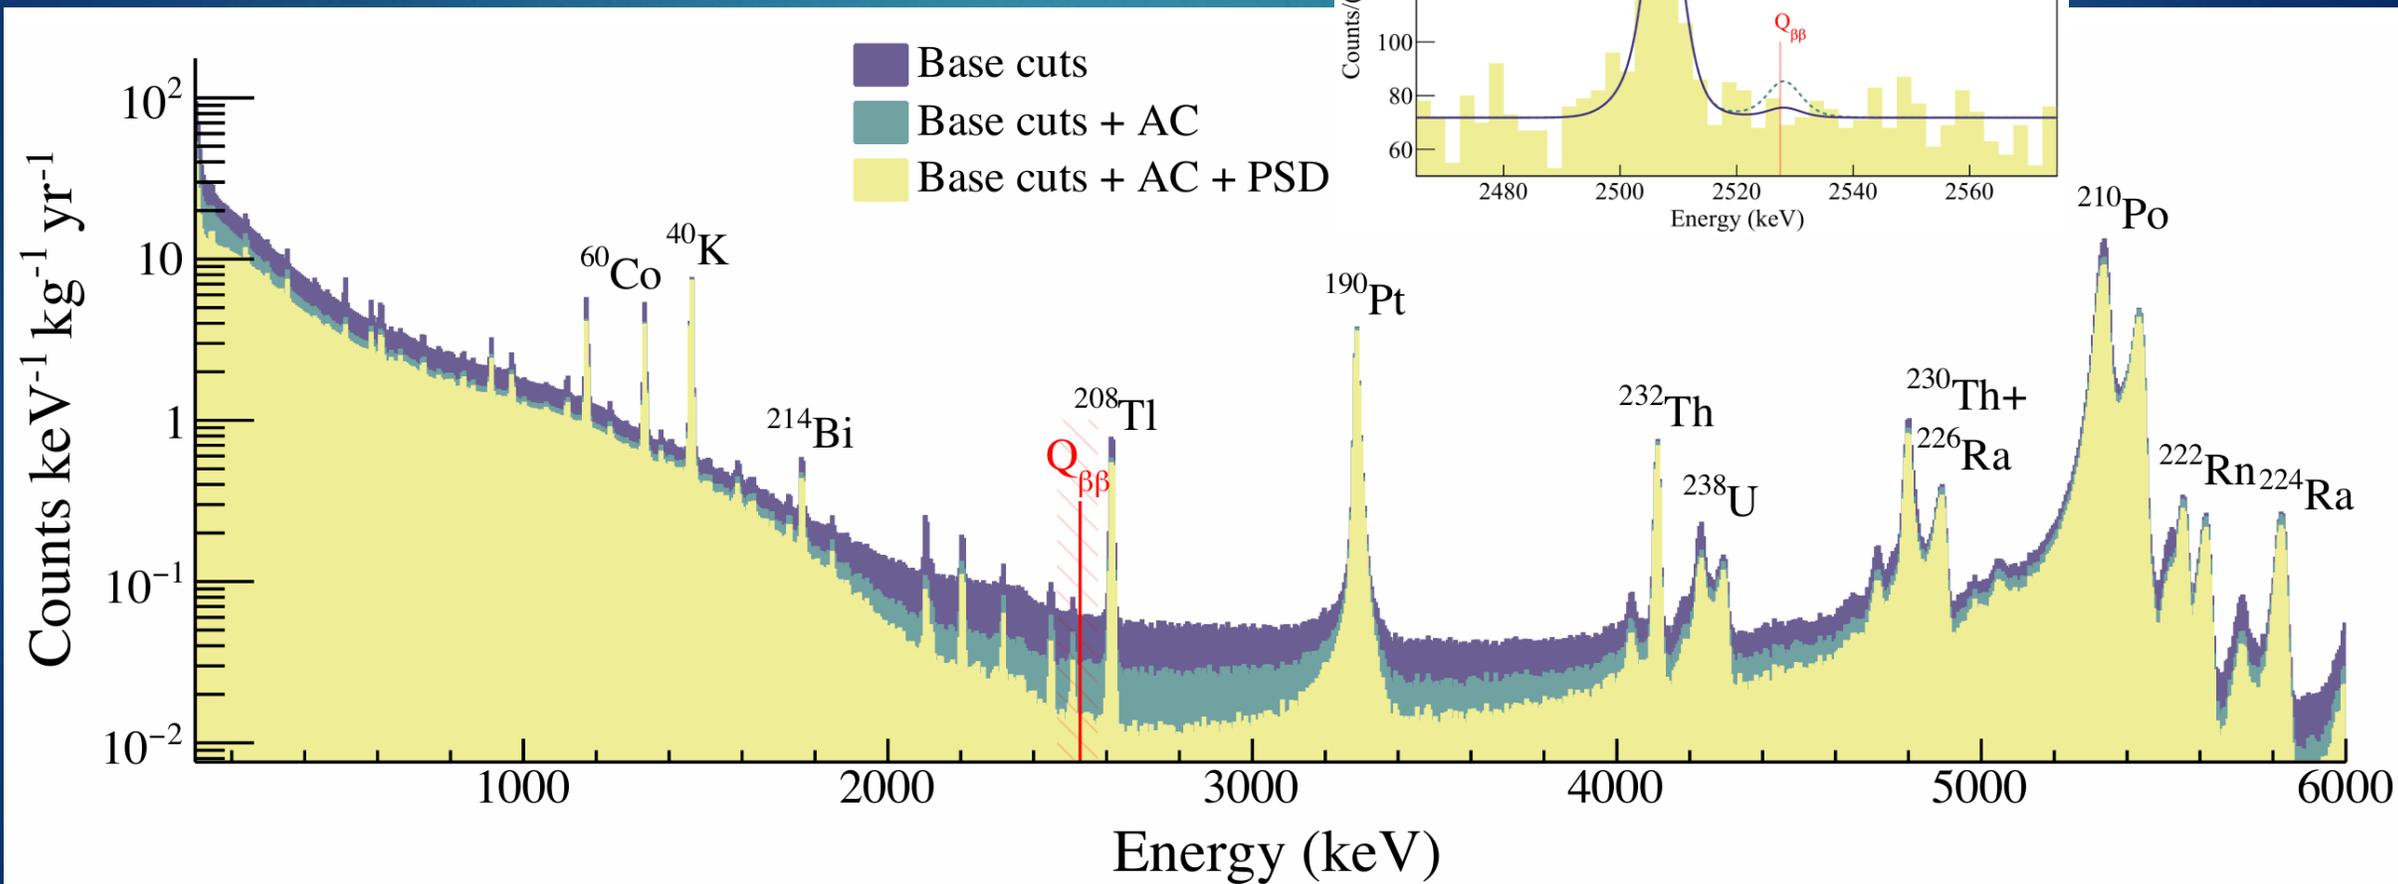

- ① [Alduino, C. et al. \(CUORE Collaboration\), Phys. Rev. Lett. 120, 132501 \(2018\)](#)
- ② [Adams, D.Q. et al. \(CUORE Collaboration\), Phys. Rev. Lett. 124, 122501 \(2020\)](#)
- ③ [Adams, D.Q. et al. \(CUORE Collaboration\), \*\*Nature\*\* 604, 53-58 \(2022\)](#)
- ④ [Adams, D. Q. et al. \(CUORE Collaboration\), \*\*Science\*\* 390,1029-1032\(2025\)](#)

# 2 ton · yr exposure

► Bayesian limit:  $T_{1/2}^{0\nu} > 3.5 \cdot 10^{25}$  yr  
@ 90% C.I.

Adams, D. Q. et al. (CUORE Collaboration),  
*Science* 390,1029-1032(2025).

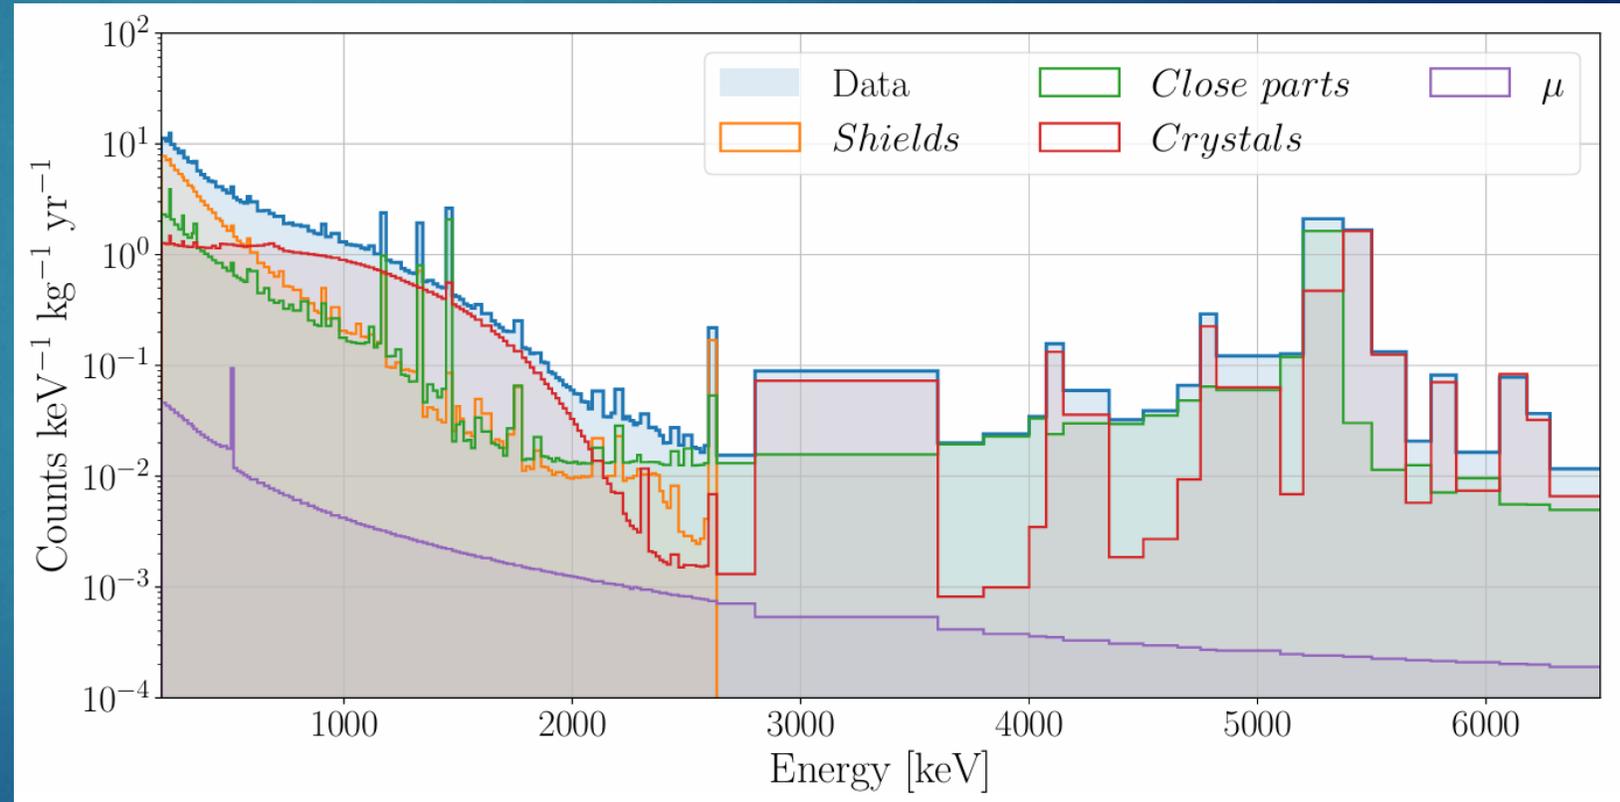

# Background model results

8

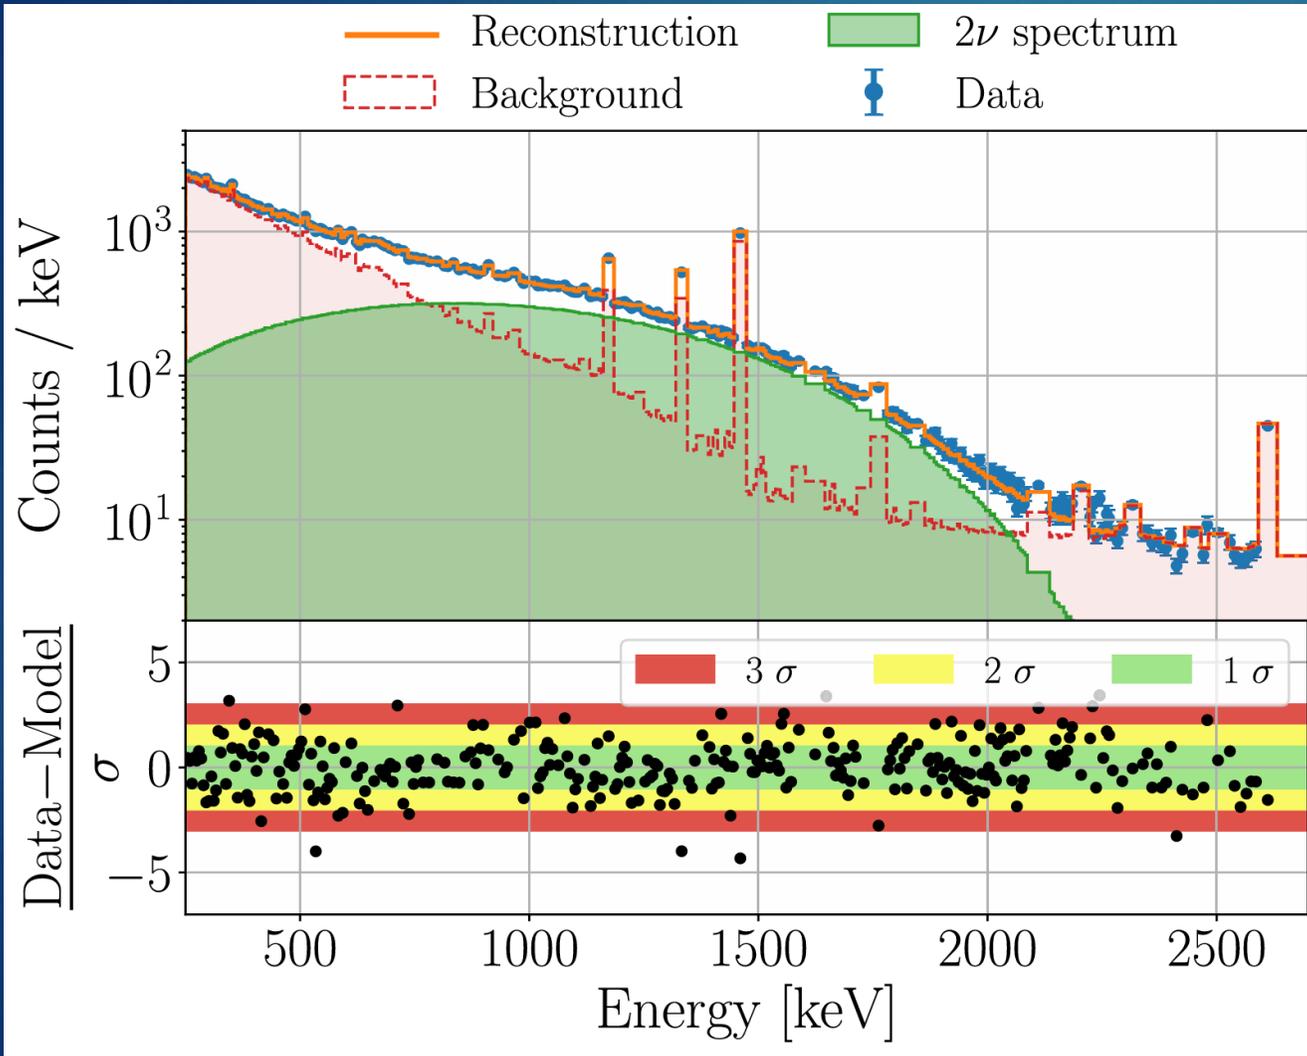

- ▶ Full detector geometry and particle interaction implemented in Geant4
- ▶ Geant4 output post-processed to include detector response
- ▶ 62 simulated sources (bulk, surface, muons)
- ▶ Coincidence events used to constrain source location
- ▶ JAGS-based MCMC binned Bayesian fit
- ▶ Uniform priors for all components, except muons

[Adams, D.Q. et al. \(CUORE Collaboration\), Phys. Rev. D 110, 052003 \(2024\)](#)

# $2\nu\beta\beta$ decay measurement

9

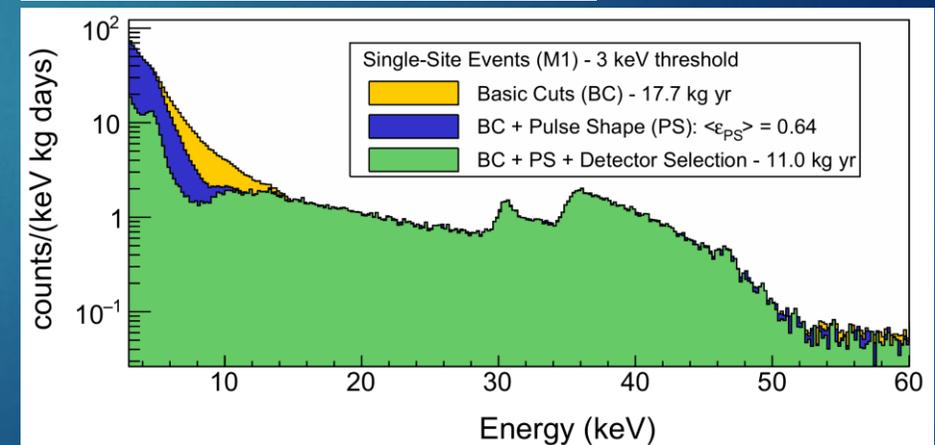

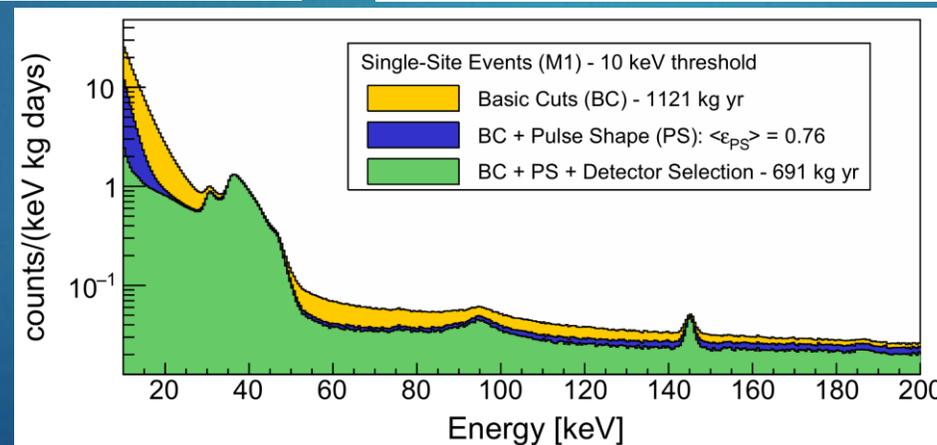

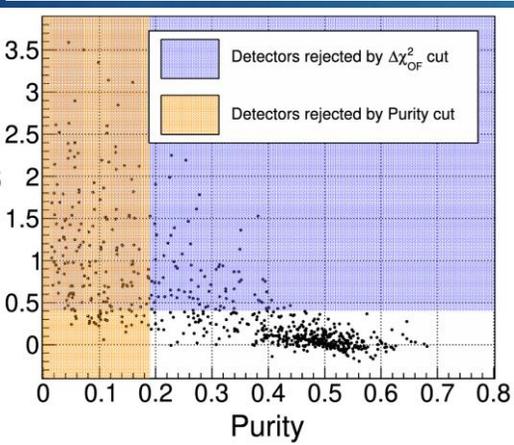

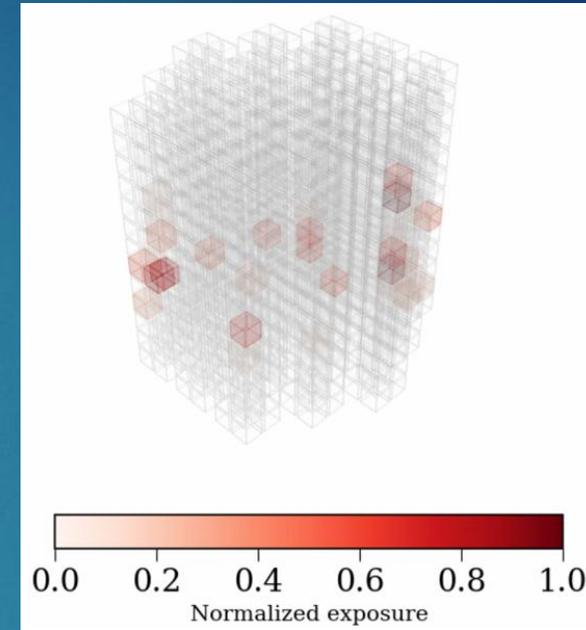

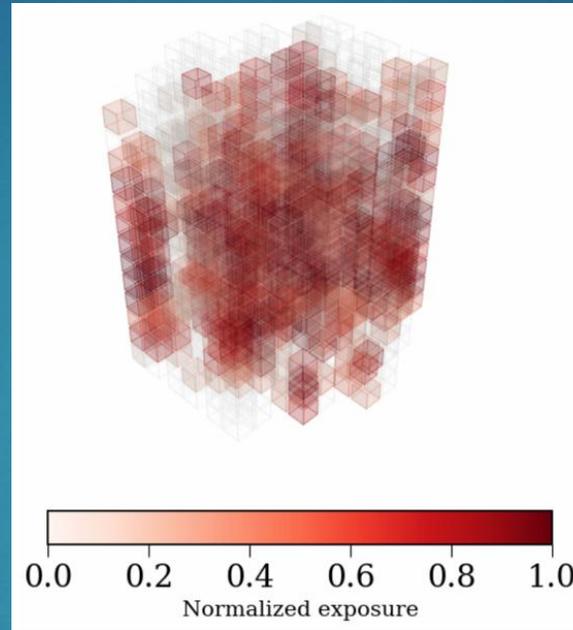

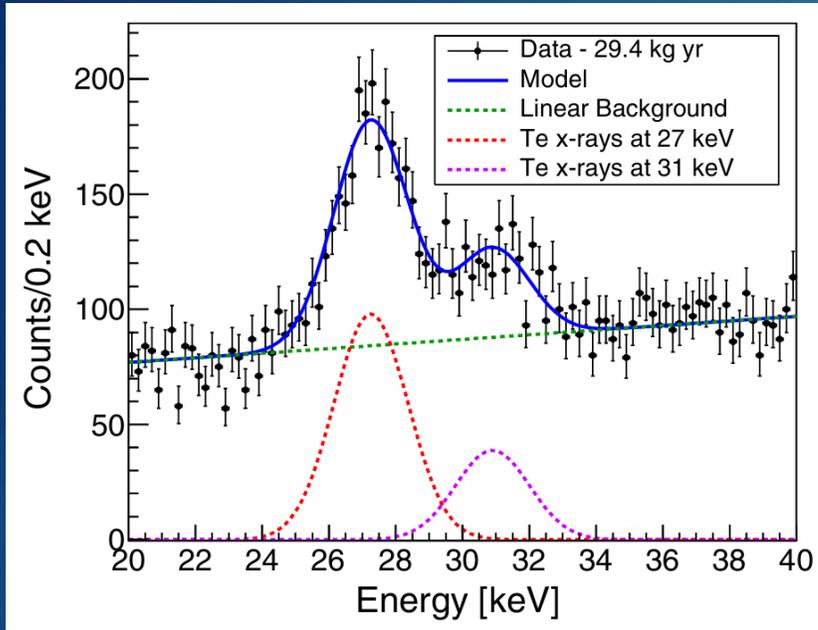

- ▶  $^{130}\text{Te}$   $2\nu\beta\beta$  component from background model fit to single hits (M1) data
- ▶  $^{130}\text{Te}$   $2\nu\beta\beta$  > 50% of events in the 1~2 MeV energy region
- ▶ Spectral fit
- ▶  $T_{1/2}^{2\nu} = 9.32_{-0.04}^{+0.05}(\text{stat.})_{-0.07}^{+0.07}(\text{syst.}) \times 10^{20}$  yr
- ▶ Most precise measurement of  $^{130}\text{Te}$   $2\nu\beta\beta$  decay half-life to date

[Adams, D.Q. et al. \(CUORE Collaboration\), Phys. Rev. Lett. 135, 082501 \(2025\)](#)

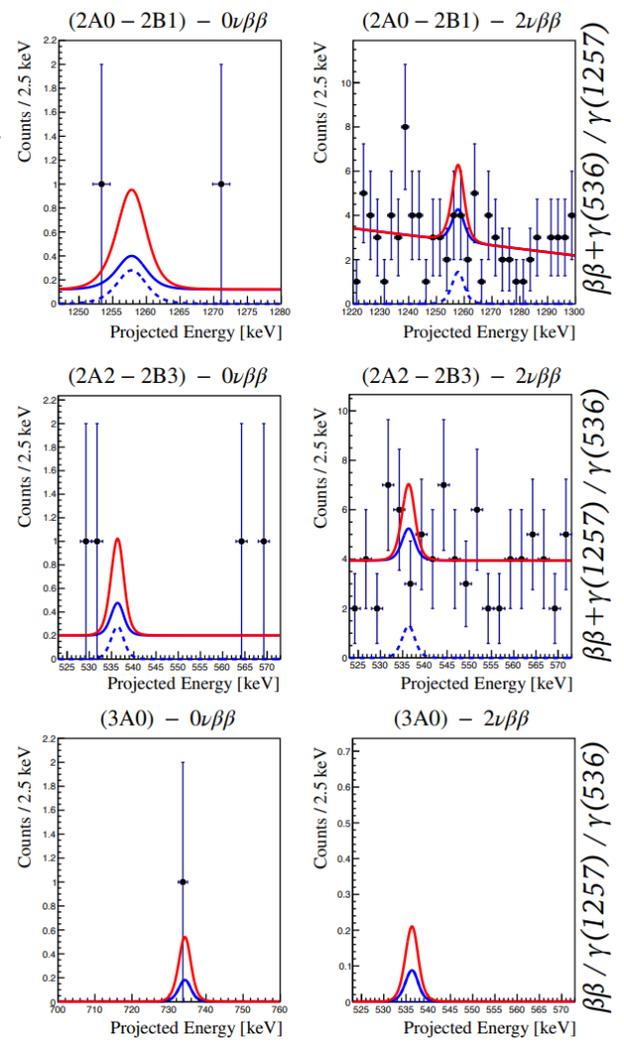

# Exploring the keV-scale

Adams, D.Q. et al. (CUORE Collaboration),

## Fractionally Charged Particles

Adams, D.Q. et al. (CUORE Collaboration), *Phys. Rev. Lett.* 133, 241801 (2024)

## Correlations between CUORE low frequency noise and sea waves

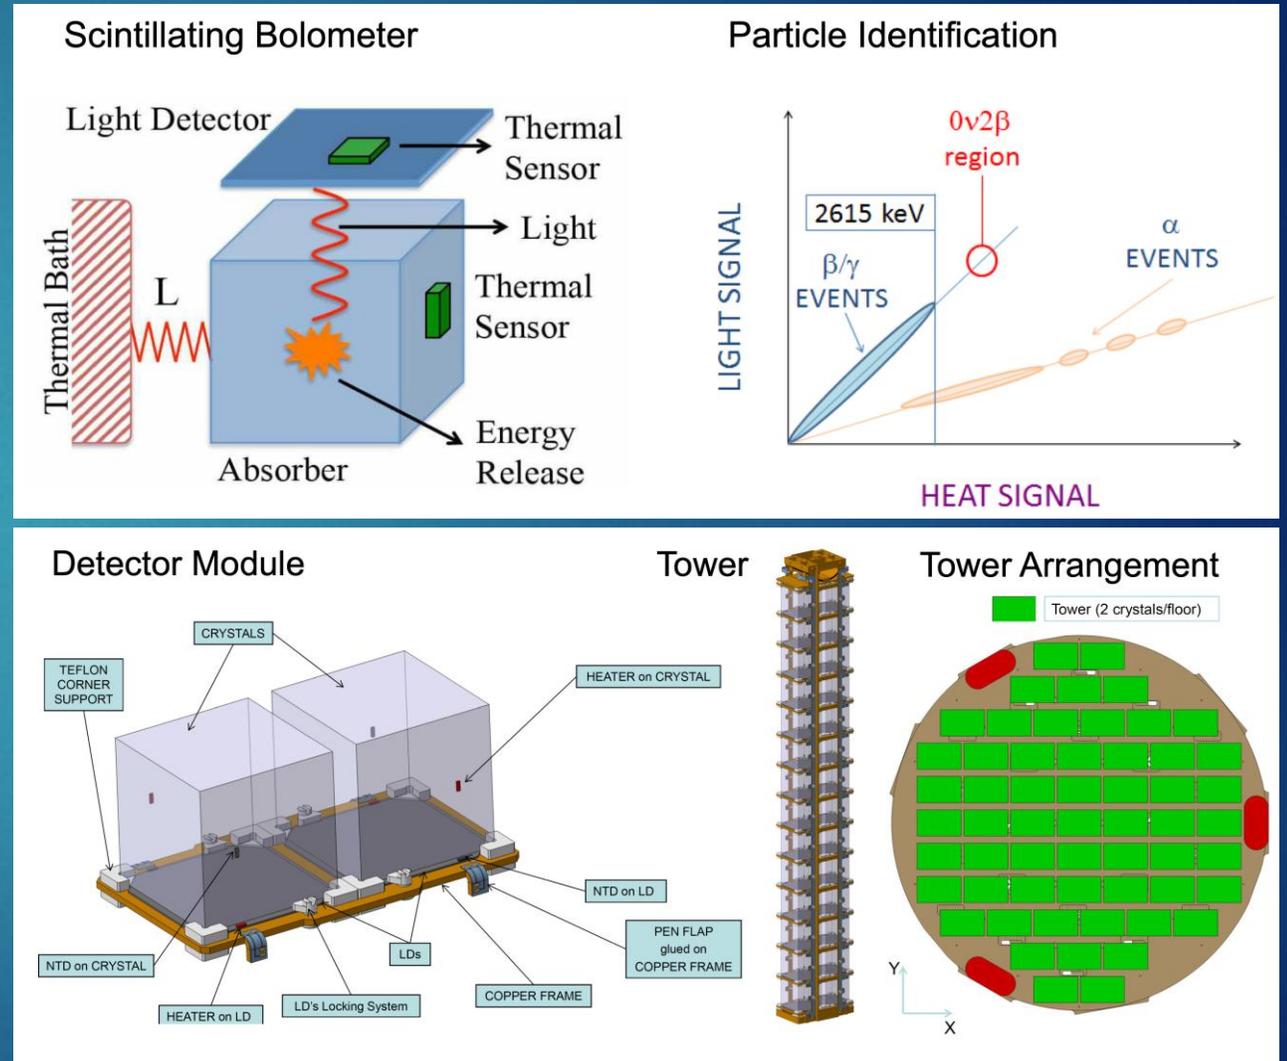

Aragão, L. et al., *Eur. Phys. J. C* 84, 728 (2024)

# What's next?

13

- ▶ CUORE phase-I (current)
  - ▶ Run up to mid-2026
  - ▶ Reach  $> 3 \text{ ton} \cdot \text{yr TeO}_2$ ,  $1 \text{ ton} \cdot \text{yr } ^{130}\text{Te}$  exposure (largest ever collected for  $^{130}\text{Te}$ )
  - ▶ Room for multiple rare events searches with high statistic, optimal energy resolution and low background
- ▶ CUORE phase-II
  - ▶ Cryogenic interventions to improve noise and push towards low energy studies
  - ▶ Plan to resume data-taking in 2026
- ▶ CUPID (CUORE Upgrade with Particle Identification)
  - ▶ Scintillating cryogenic calorimeters:
  - ▶  $\alpha$  vs  $\beta/\gamma$  and  $\beta\beta$  pile-up rejection using light signal
  - ▶ Background: goal of  $10^{-4}$  counts / (keV · kg · yr)
  - ▶ Energy resolution: goal of 5 keV at  $Q_{\beta\beta}$

- ▶ CUORE Upgrade with Particle IDentification
- ▶  $^{100}\text{Mo}$   $0\nu\beta\beta$  decay candidate:
  - ▶  $Q_{\beta\beta} \sim 3034 \text{ keV}$
- ▶ New detector technology:
  - ▶ scintillating calorimeters
- ▶ Scintillation light:
  - ▶  $>99\%$   $\alpha/\beta$  discrimination
  - ▶  $\sim 1600 \text{ Li}_2\text{MoO}_4$  crystals
  - ▶ High energy resolution ( $\sim 5 \text{ keV}$ )

## ▶ Data Analysis and Processing

- ▶ List of the possible analysis in CUORE (excited states..., on 3 ton · yr data)
- ▶ Background model and sensitivity studies
- ▶ Search for Beyond Standard Model processes in CUORE
- ▶ Discovery Potential for Supernova Neutrinos
- ▶ Dark Matter searches
- ▶ Development of algorithm for pileup-rejection in CUPID
- ▶ Pulse shape studies for alpha tagging in CUPID

- ▶ CUORE demonstrates the feasibility of a tonne-scale experiment employing **cryogenic bolometers**, for the search of the  $0\nu\beta\beta$  decay and some other rare events.
- ▶ A raw exposure of more than **3.1 ton·yr TeO<sub>2</sub>** has been achieved as of today!
  - ▶ The data-taking is proceeding with  $\geq$  **85% uptime**.
- ▶ CUORE released physics results of  $^{130}\text{Te}$   $0\nu\beta\beta$  decay, utilizing 2 ton·yr TeO<sub>2</sub> data.
- ▶ No evidence of  $0\nu\beta\beta$  decay with observed data.
  - ▶ Bayesian 90% C.I. limit.
- ▶ CUORE obtained the most precise half-life measurement for the  **$2\nu\beta\beta$  decay of  $^{130}\text{Te}$** .
- ▶ CUORE will continue to take data until it reaches  $^{130}\text{Te}$  exposure of 1 ton · yr, *i.e.*, 3 ton · yr TeO<sub>2</sub> exposure.
- ▶ Thanks for the unique feature of allow deployment of different isotopes by using the same infrastructure.

$$T_{1/2}^{0\nu} > 3.5 \cdot 10^{25} \text{ yr @ 90\% C.I.}$$

$$T_{1/2}^{2\nu} = 9.32_{-0.04}^{+0.05}(\text{stat.})_{-0.07}^{+0.07}(\text{syst.}) \times 10^{20} \text{ yr}$$

CUORE Upgrade with  
Particle IDentification

## Thank you for your attention!

krystal

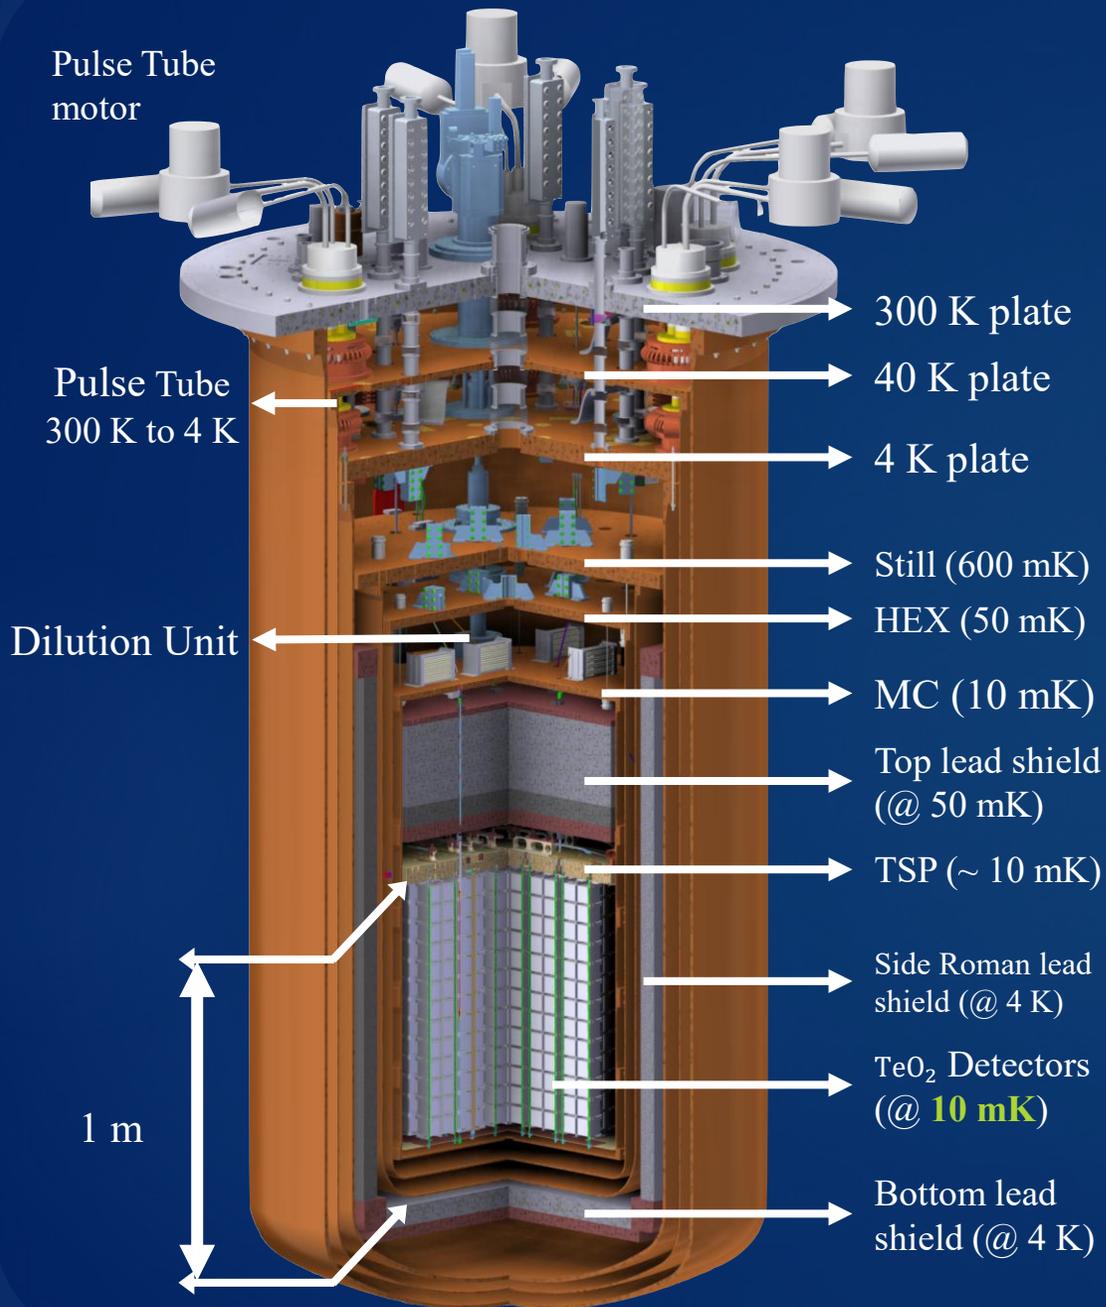

Carlo Bucci

# Backup

# CUORE Cryostat

19

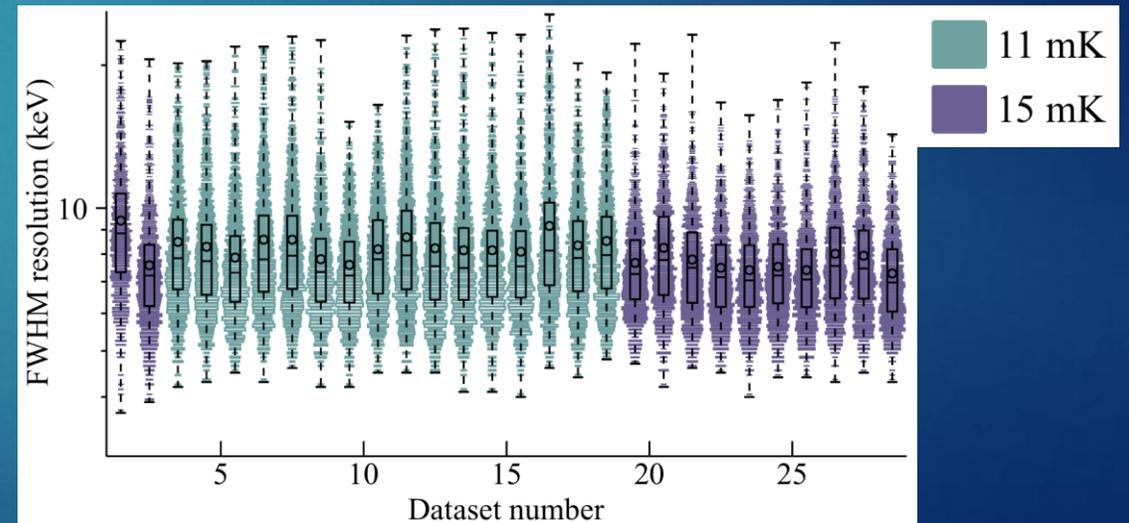

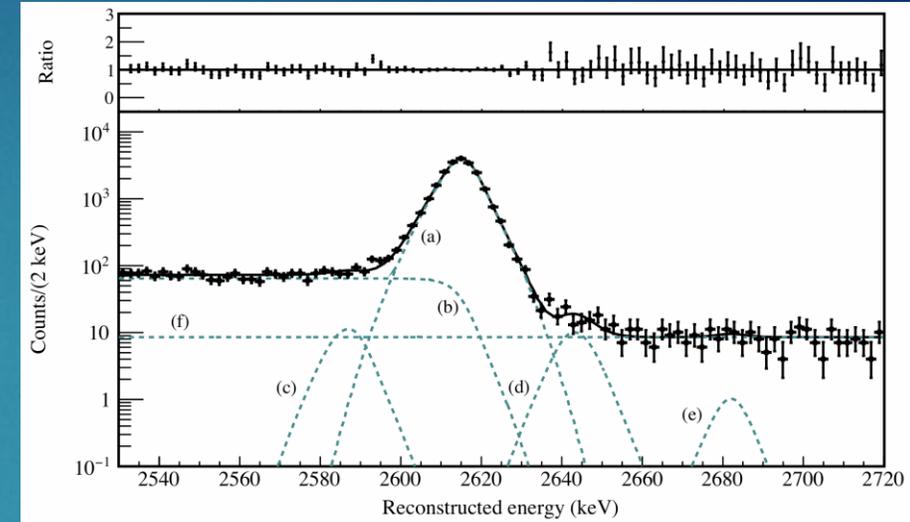

- ▶ Custom-made dry dilution refrigerator
- ▶ 1.5 t of material at base temperature for ~5 years!
- ▶ 5 pulse-tube refrigerators (1 spare)
  - ▶ Relative phases tuned for noise cross-canceling
- ▶ 6 nested vessels at decreasing temperatures
- ▶ Low-temperature lead shielding
  - ▶ Modern lead on top of detectors to suppress  $\gamma$ 's from cryogenic components
  - ▶ Side Roman lead shielding to suppress external  $\gamma$ 's
- ▶ 742 kg TeO<sub>2</sub> detectors, 206 kg <sup>130</sup>Te (34% natural isotopic abundance)
- ▶ 988 crystal bolometric array
- ▶ arranged in 19 towers with 13 floors each, 52 5 × 5 × 5 cm<sup>3</sup> TeO<sub>2</sub> crystals per tower

# Detector performance

Adams, D. Q. et al. (CUORE Collaboration),  
*Science* 390,1029-1032(2025)

20

- ▶ Peak lineshape:
  - ▶ Reference  $^{208}\text{Tl}$  gamma peak at 2615 keV from calibration data
- ▶ Fit model:
  - ▶ Multi-Gaussian response function
  - ▶ Multi-Compton background
  - ▶ Flat background
  - ▶ Coincidence/escape peaks
- ▶ Fit at channel-dataset level
- ▶ Energy resolution at 2615 keV
  - ▶  $\text{FWHM} = (7.540 \pm 0.024) \text{ keV}$ 
    - ▶ harmonic mean - exposure weighted

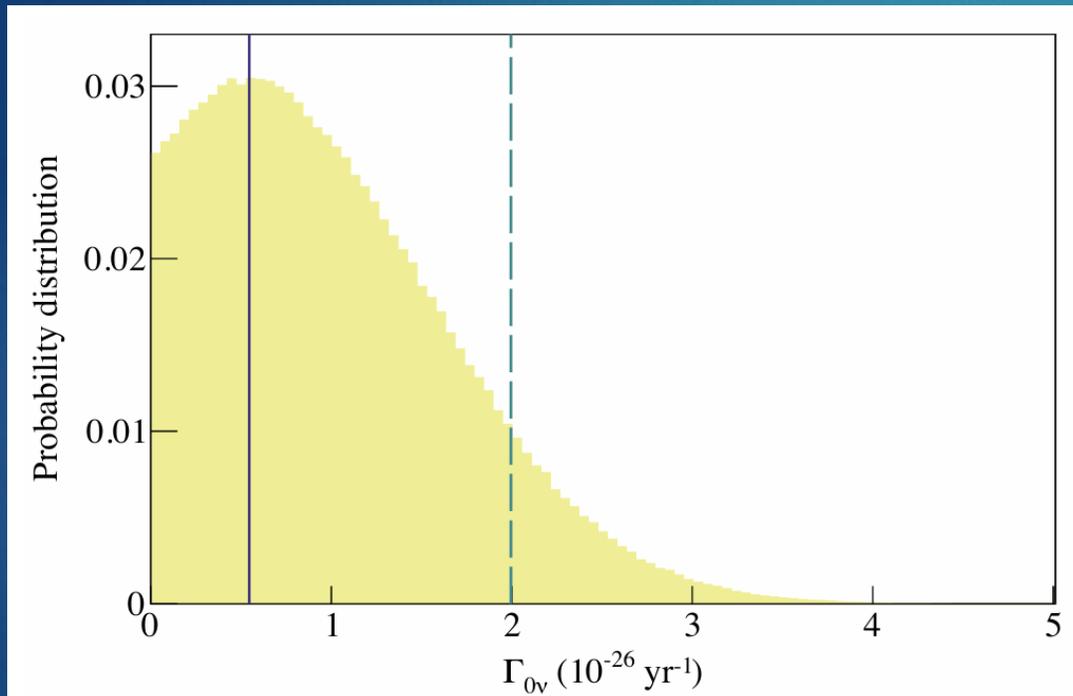

# $0\nu\beta\beta$ decay results

Adams, D. Q. et al. (CUORE Collaboration),  
*Science* 390,1029-1032(2025).

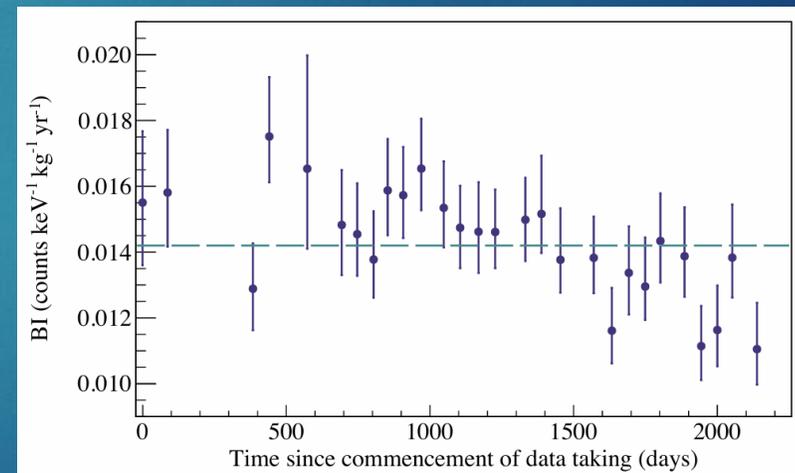

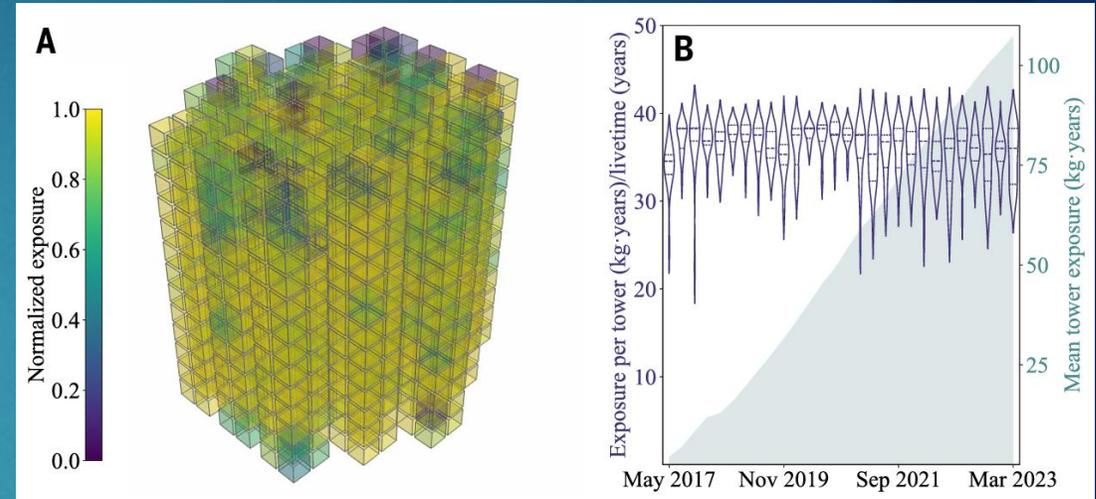

21

## ► Resolution scaling

- FWHM at  $Q_{\beta\beta} = (7.310 \pm 0.024)$  keV

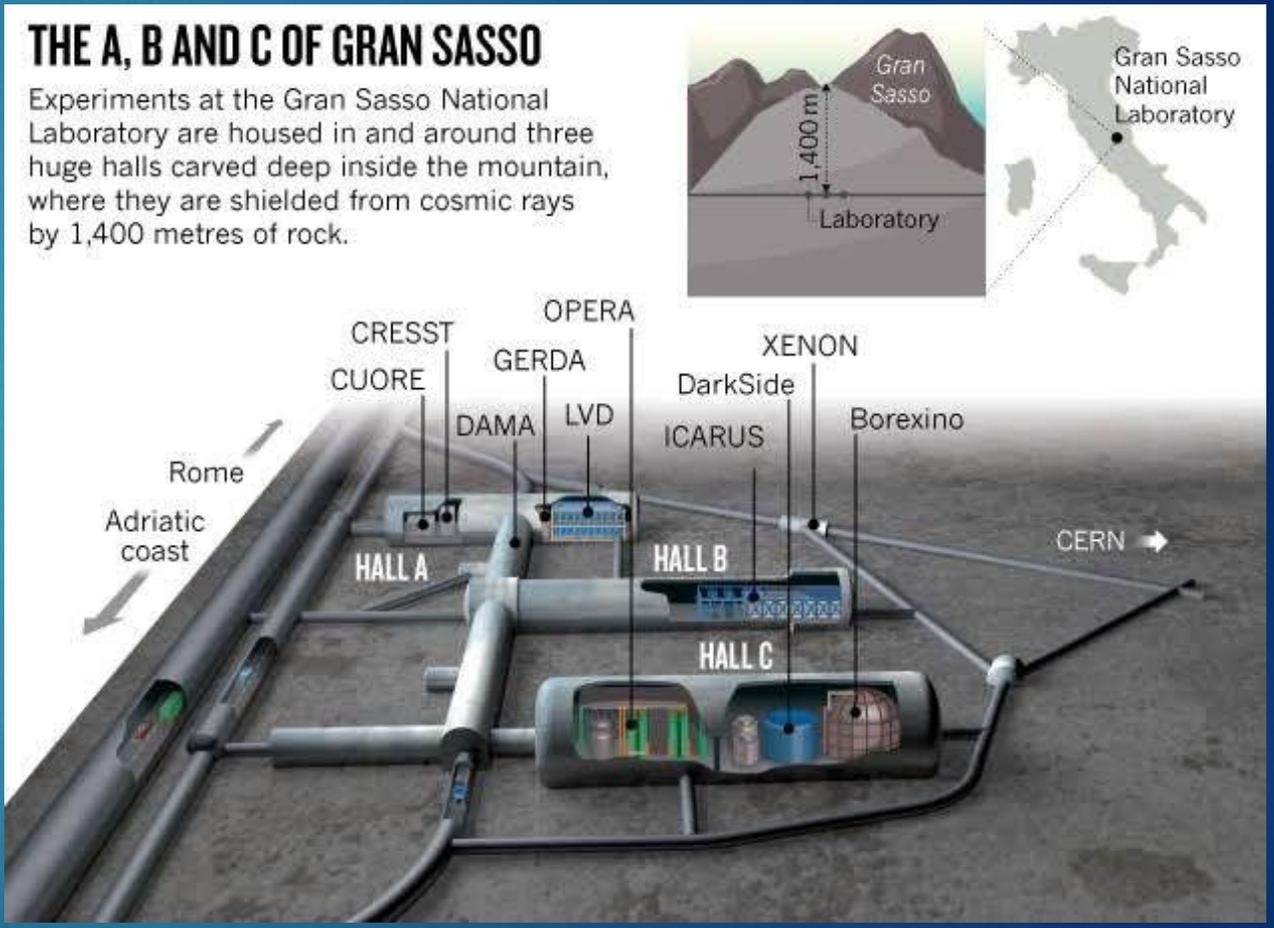

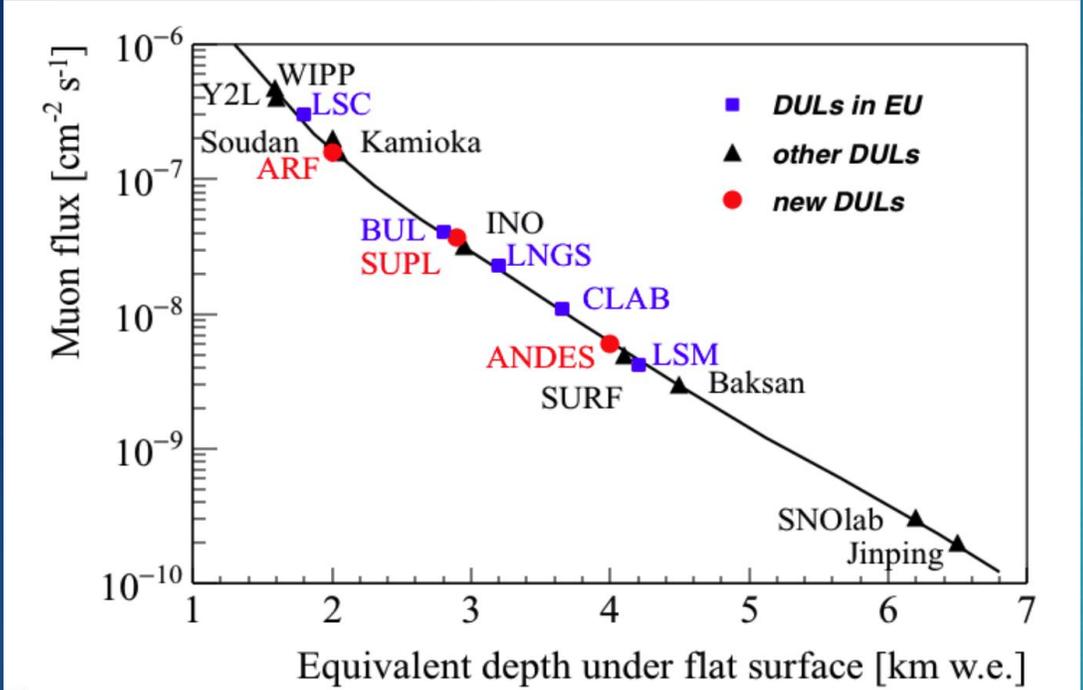

- Bayesian limit:  $T_{1/2}^{0\nu} > 3.5 \cdot 10^{25} \text{ yr}$   
@ 90% C.I.

- BI:  $(1.42^{+0.03}_{-0.02}) \cdot 10^{-2} \text{ counts} / (\text{keV} \cdot \text{kg} \cdot \text{yr})$

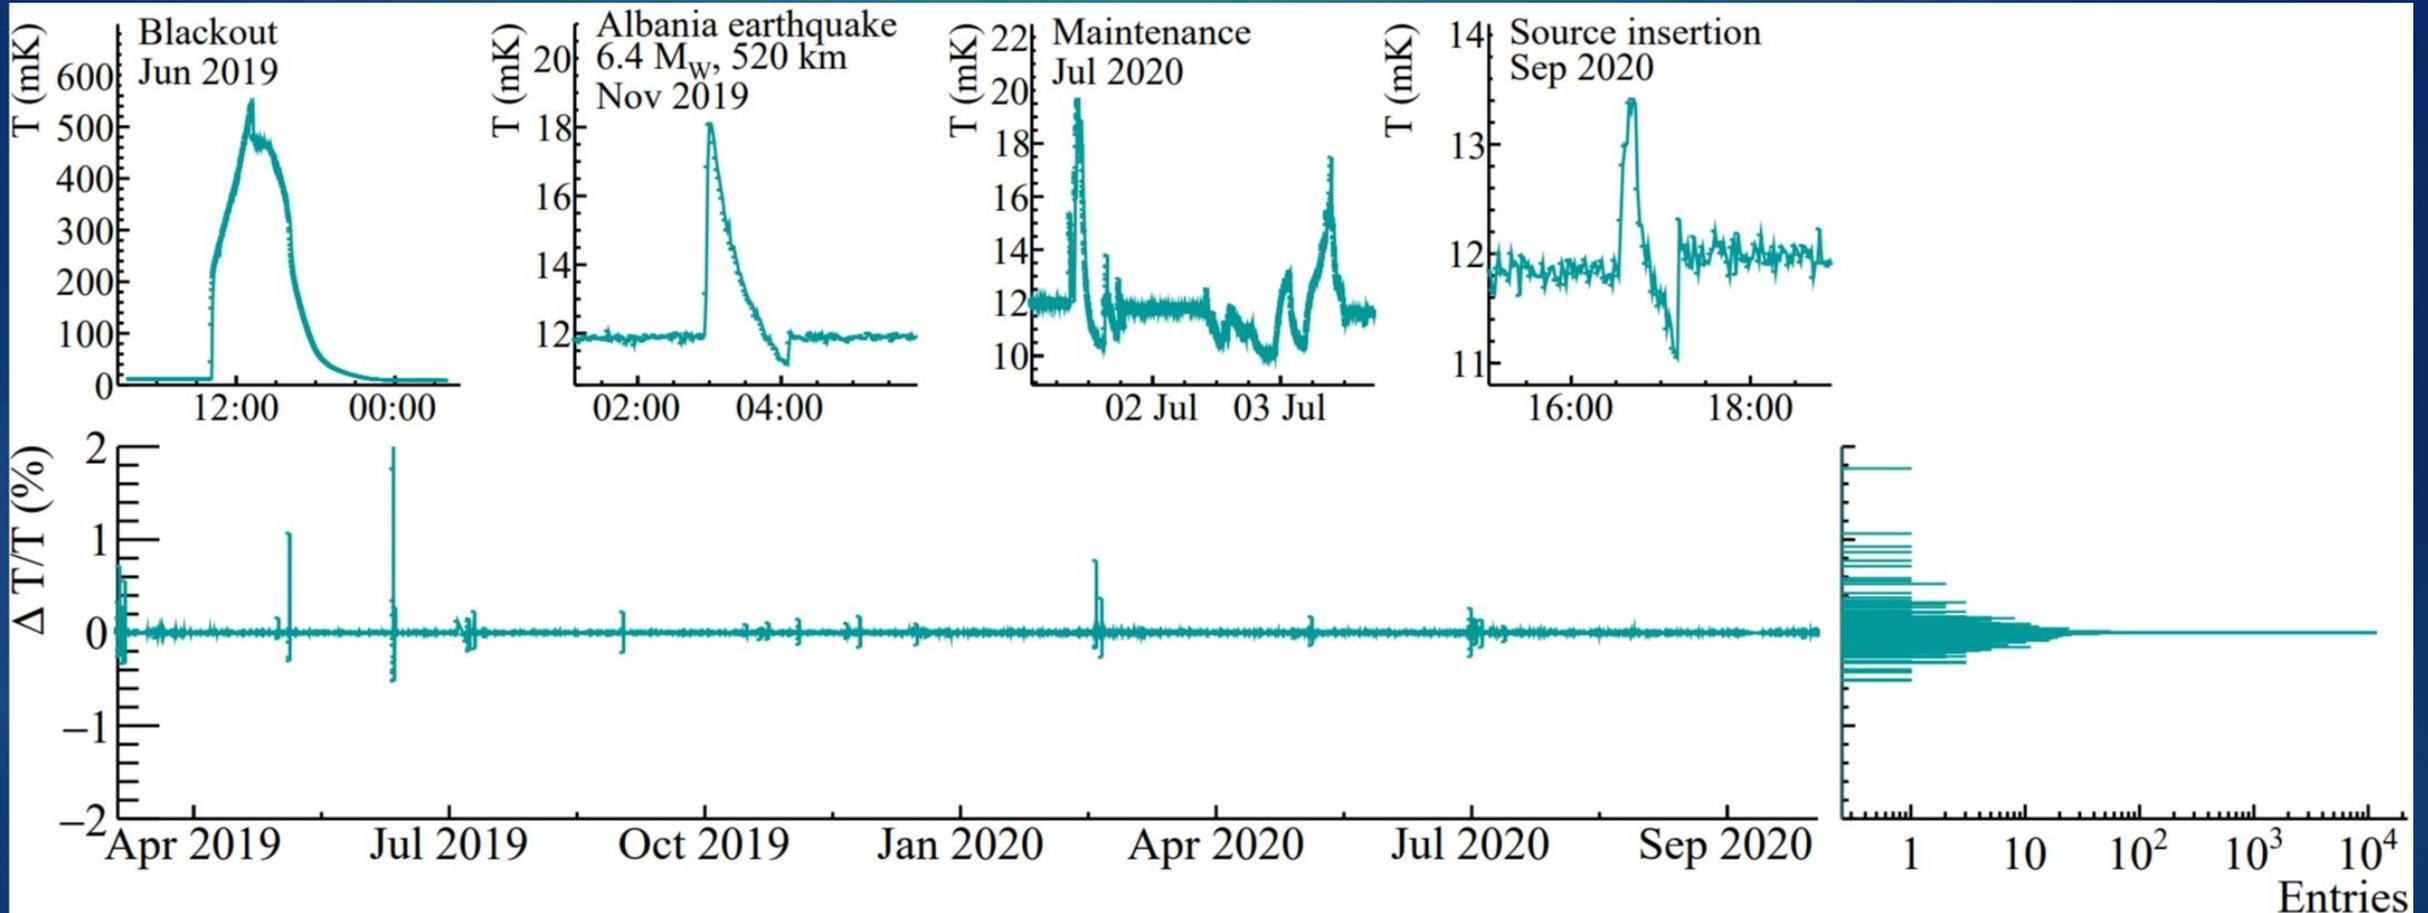

# Laboratori Nazionali del Gran Sasso - Italy

- ▶ 3600 m.w.e. deep
- ▶  $\mu$ :  $\sim 3 \times 10^{-8} / (\text{s cm}^2)$   
→  $10^6$  less than above ground
- ▶  $\gamma$ :  $\sim 0.73 / (\text{s cm}^2)$
- ▶ neutrons:  $< 4 \times 10^{-6} \text{ n} / (\text{s cm}^2)$

# The cryostat performance
