Oliviero Cremonesi

Paolo Gorla

Neutrinoless double beta decay ($0\nu\beta\beta$)

- Double beta decay: rare second order β decay
 $Z \rightarrow Z \pm 2$
- Allowed for certain even-even nuclei where the standard single β decay is energetically forbidden

- Two decay modes:

✓
OBSERVED

- two-neutrino double beta decay

$$|\Delta L| = 0$$

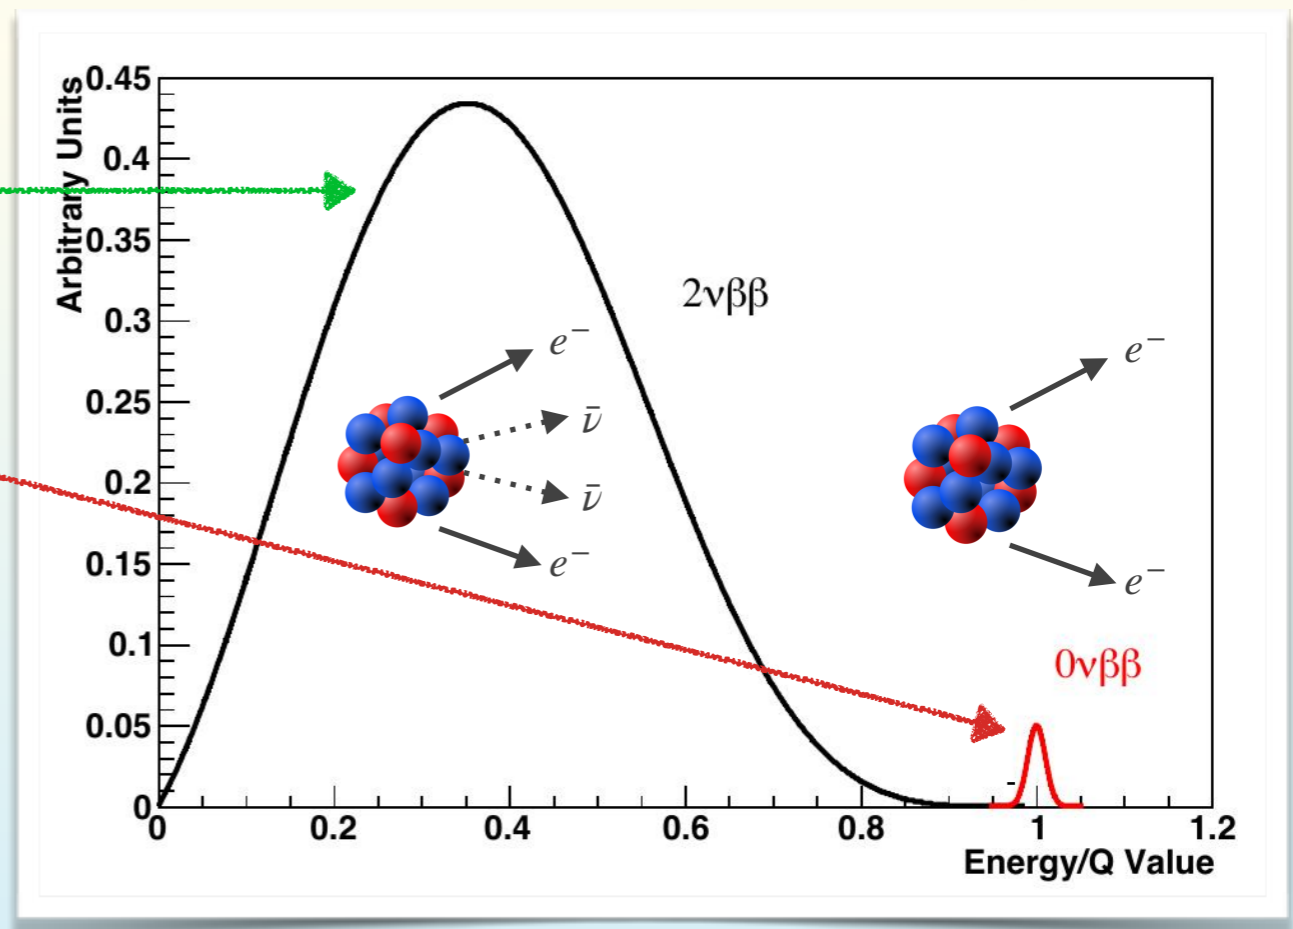

- **neutrinoless double beta decay?**

$$|\Delta L| = 2$$

Standard Model forbidden

WHAT IF OBSERVED?

- Lepton number violation
- Majorana nature of the neutrino
- Constrains on absolute ν mass scale and hierarchy

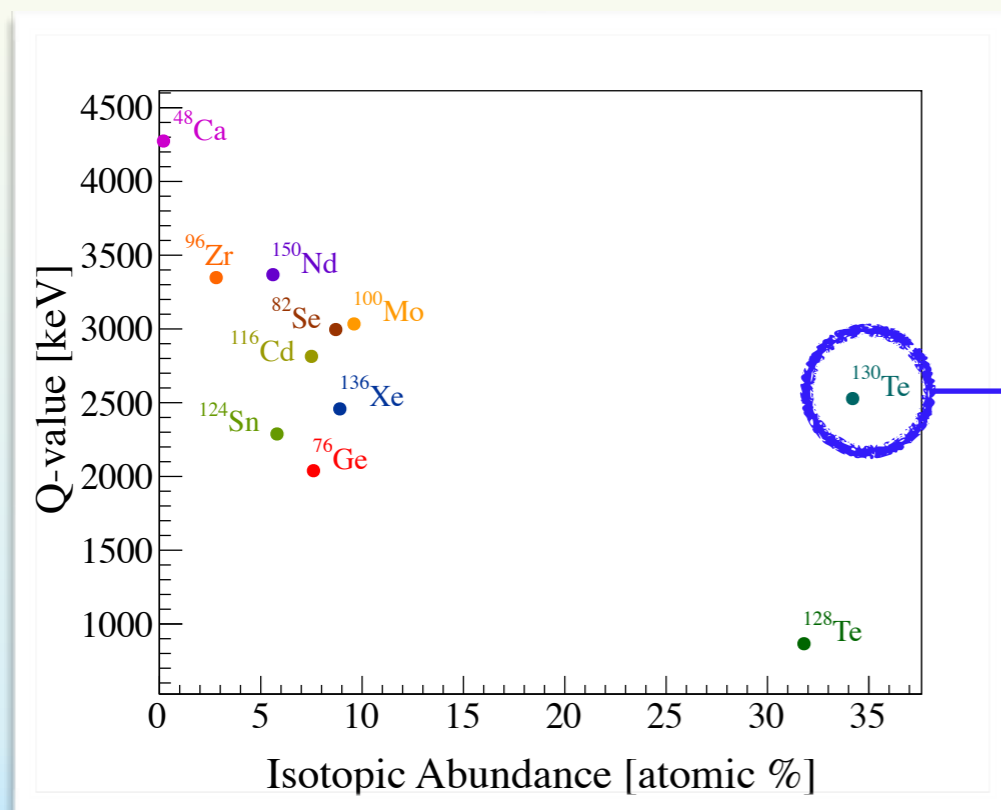

CUORE: Cryogenic Underground Observatory for Rare Events

Search for $0\nu\beta\beta$ decay of ^{130}Te with cryogenic bolometers:

- Excellent energy resolution (few ‰)
- TeO_2 bolometer: ^{130}Te is a constituent of the detector itself $\longrightarrow \epsilon \sim 90\%$
- Signal amplitude: $\propto \Delta T = \frac{\Delta E}{C(T)}$, $C(T) \propto T^3$
- **Cryogenic temperature needed (~ 10 mK)**

CUORE: $0\nu\beta\beta$ in ^{130}Te

- $\eta(^{130}\text{Te}) = 34.167\%$
- $Q_{value} = 2528$ keV : between the highest ^{208}Tl peak and its Compton edge

CUORE: Cryogenic Underground Observatory for Rare Events

- 988 cryogenic TeO_2 bolometers
- 742 kg of total TeO_2 mass, with ~ 206 kg of ^{130}Te emitter isotope
- Bolometers working temperature: ~ 10 mK (custom built multi-stage cryostat)

CUORE background model

BACKGROUND MODEL: identify, locate and evaluate the intensity of all the sources contributing to the observed background spectra

Detailed Monte Carlo simulation

- Geometry of the experimental setup
- Radioactive sources and their locations
- Radiation interactions with the different parts of the detector
- Detector response, instrumental effects (thresholds, resolution,...)

Granularity of the detector exploited:

INNER AND OUTER LAYER

EVENT MULTIPLICITY
(M1, M2, ...)

CUORE background model

Primary contribution to the background in CUORE:
contamination of the crystal and the copper shields

- 60 background sources simulated
- Bayesian MCMC fit with flat priors (except muons):

Radioactive sources

TeO₂ crystals and copper contamination:

- α Region (above 2615 keV):**
- All main α from ²³⁸U chain
 - All main α from ²³²Th chain
 - ¹⁹⁰Pt (crystal bulk)

- β – γ Region (below 2615 keV):**
- tails of the degraded α emitted by material surfaces
 - ²³²Th chain γ lines
 - ²³⁸U chain γ lines
 - ⁴⁰K (environment)
 - ⁶⁰Co (Cu cosmogenic activation)
 - ²¹⁰Po, ^{108m}Ag, ²⁰²Pb, ²⁰⁷Bi

A better understanding of the amount and the position of these contaminants will improve the present background model.

Understanding the radioactive sources

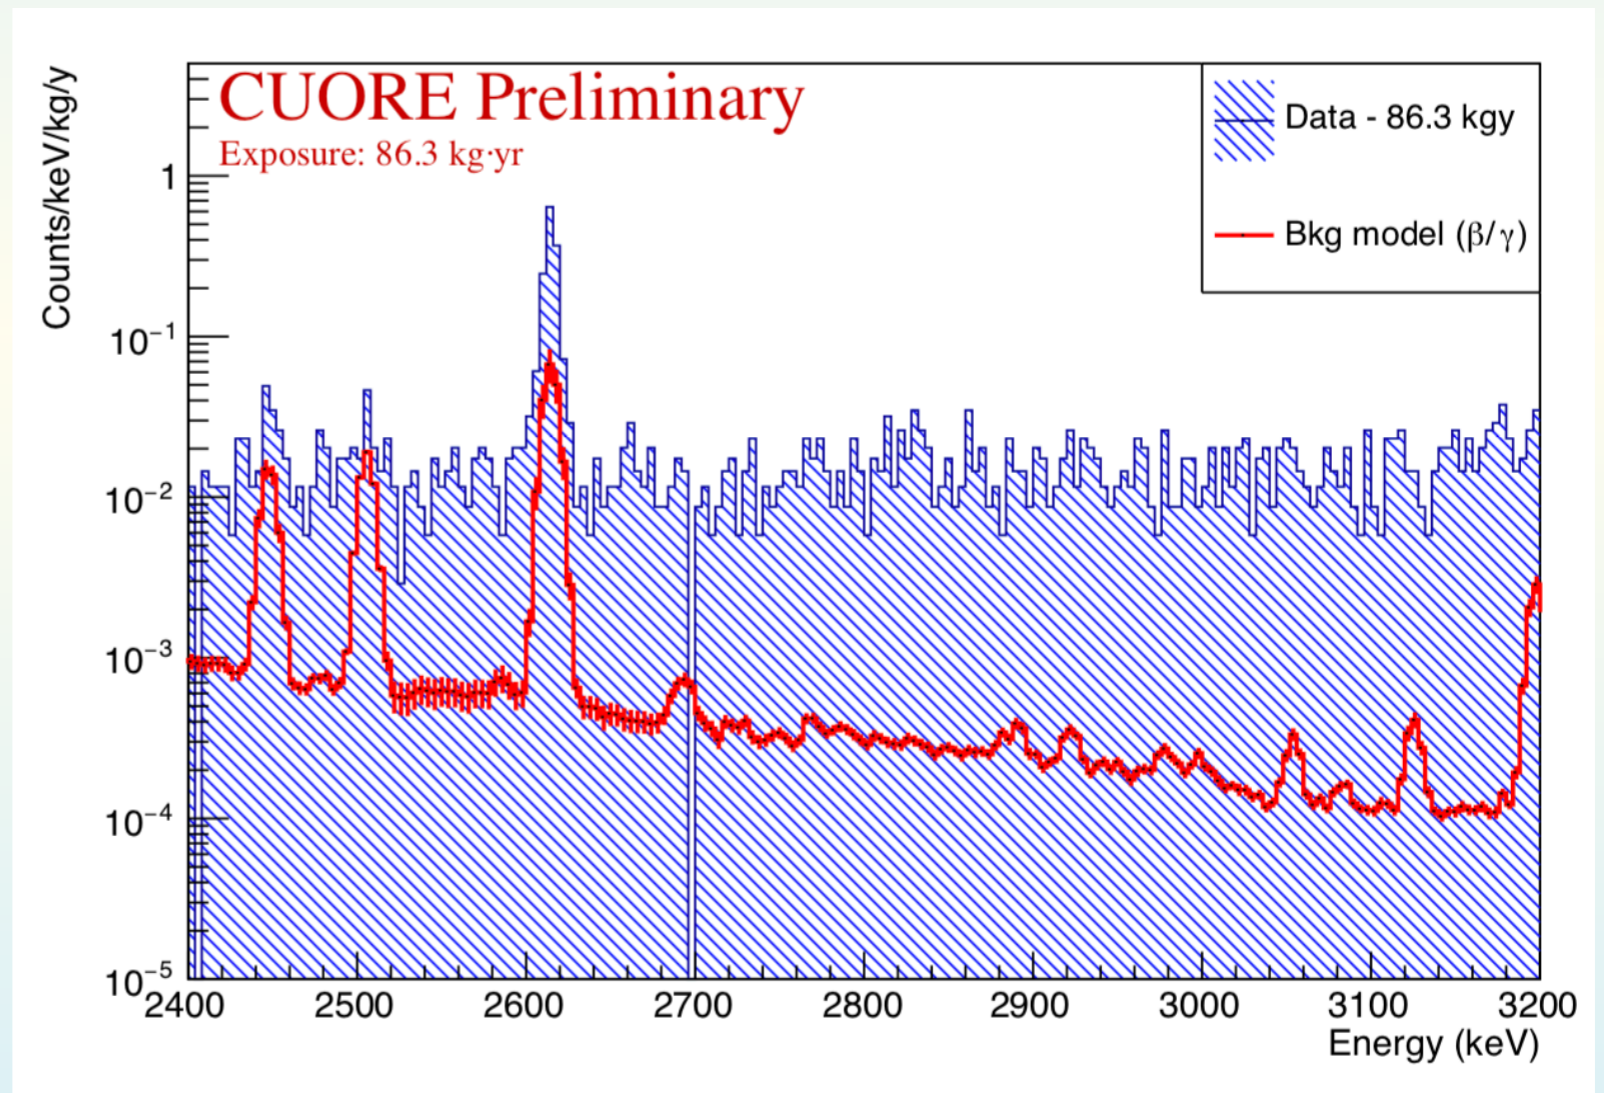

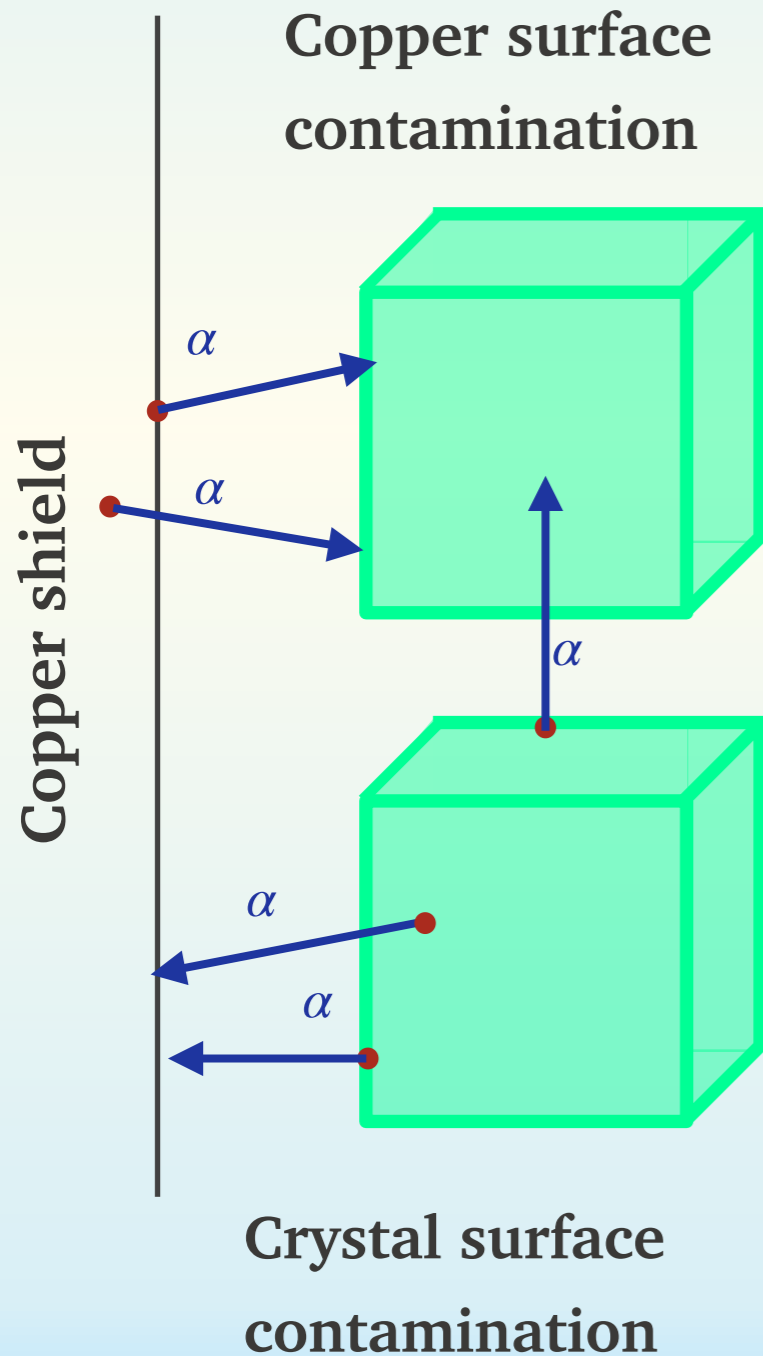

- Contaminations topology
- Time dependence of the contaminations rate
- Event correlations (coincidence)

- The following preliminary analysis includes data from spring 2017 to mid-summer 2019 (~400 kg yr exposure)
- I was in charge of the online monitoring of the quality of about one third of these data

GOAL: include new input to the present background model for a precise and correct interpretation of the data and results

Degraded alpha

Part of the background in the CUORE ROI (2490 - 2575 keV) is due to degraded alphas.

Alpha contributions

$$\alpha \text{ decay: } E_{\text{tot}} = E(\alpha) + E(\text{nuclear recoil})$$

Different positions of the contaminant correspond to different signatures:

Bulk contaminant

M1, $E_{\text{meas}} = E_{\text{tot}}$

Surface contaminant

M1, $E_{\text{meas}} = E(\text{recoil})$

Surface contaminant

M1, $E_{\text{meas}} = E(\alpha)$

I started investigating this case of surface contamination

Surface contaminant

M2 single energy: $E^{(1)}_{\text{meas}} = E(\alpha)$, $E^{(2)}_{\text{meas}} = E(\text{recoil})$

M2 total energy: $E_{\text{meas}} = E_{\text{tot}}$

Alpha contributions

- Study of the alpha and recoil peaks positions in energy
- Fit function: Crystalball = Gaussian function (\bar{x} = mean, σ = standard dev.) with a n power law tail smoothly joined to the Gaussian at $\bar{x} - \alpha\sigma$ (α and n are tail parameters)

$$f(x; \alpha, n, \bar{x}, \sigma) = N \cdot \begin{cases} e^{-\frac{(x - \bar{x})^2}{2\sigma^2}} & \text{for } \frac{x - \bar{x}}{\sigma} > -\alpha \\ A \cdot \left(B - \frac{x - \bar{x}}{\sigma} \right)^{-n} & \text{for } \frac{x - \bar{x}}{\sigma} \leq \alpha \end{cases}$$

Where: $A = \left(\frac{n}{|\alpha|} \right)^n \cdot e^{-\frac{|\alpha|^2}{2}}$ $B = \frac{n}{|\alpha|} - |\alpha|$ $N =$ normalization factor depending on α, n

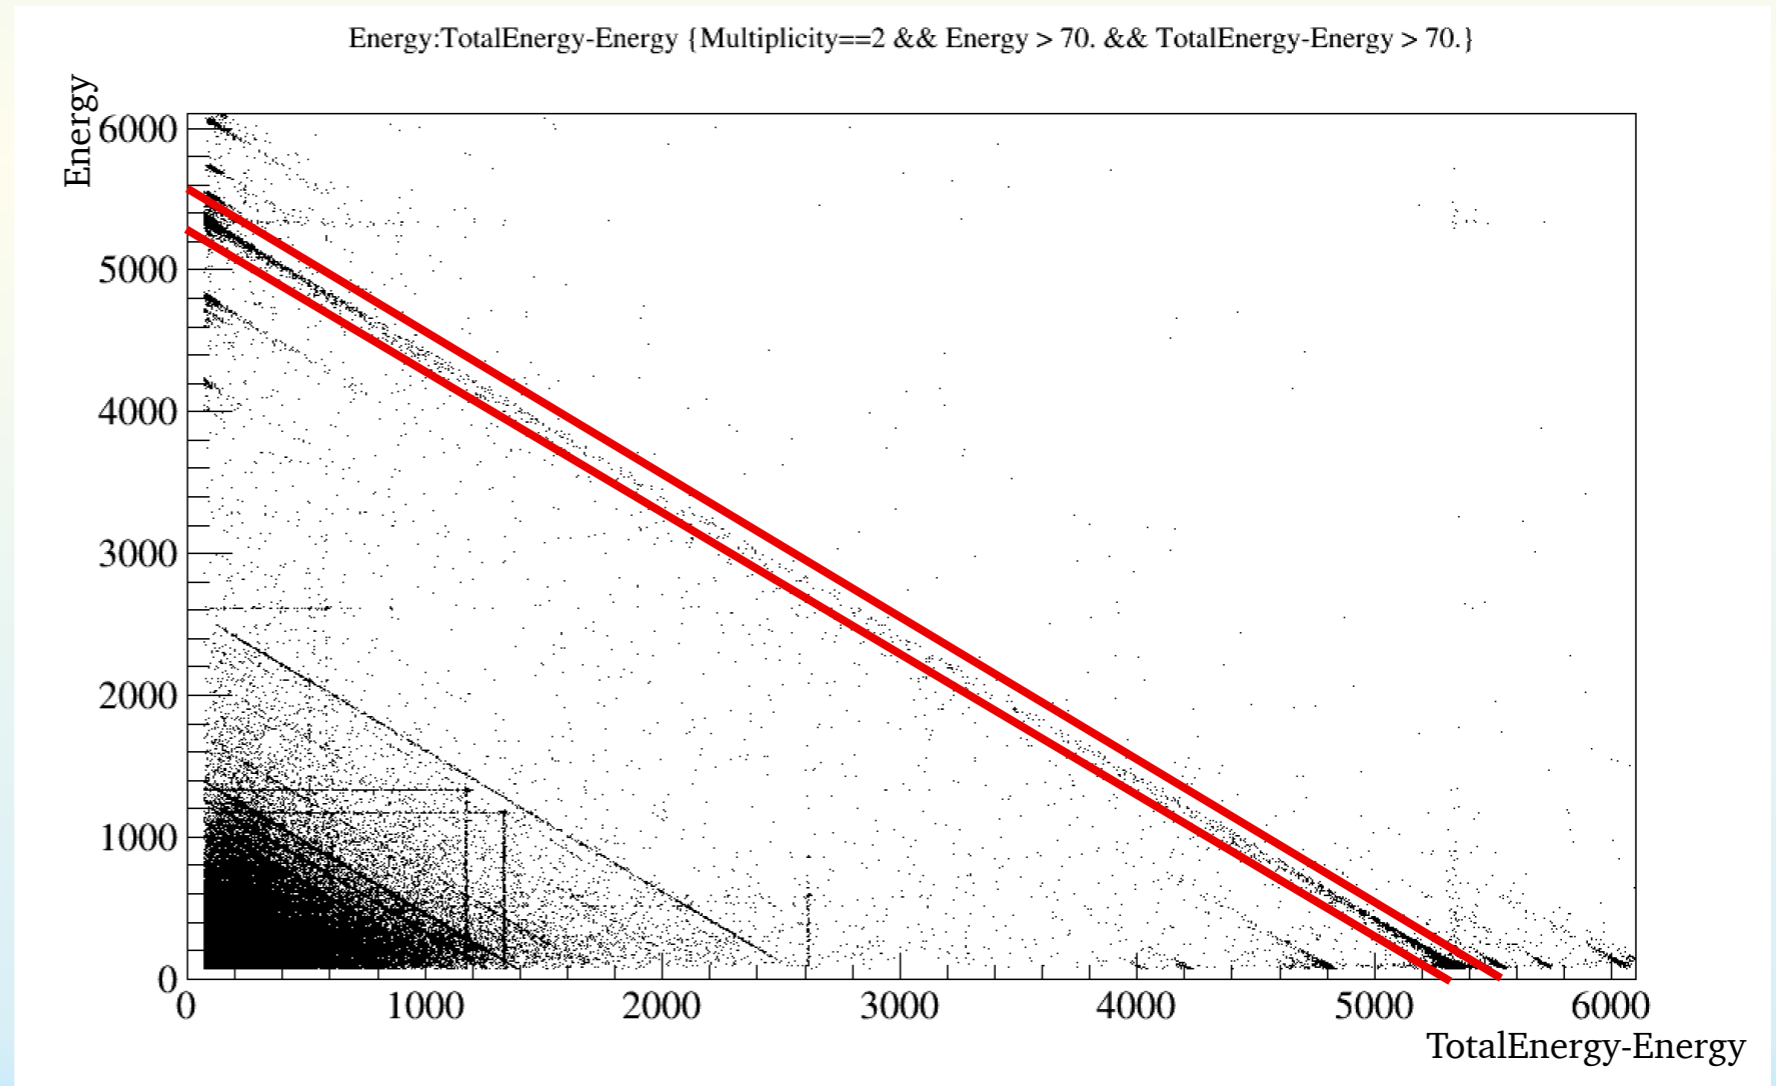

Fit parameters: $N, \alpha, n, \bar{x}, \sigma$

Alpha contributions: ^{210}Po

- $^{210}\text{Po} \rightarrow ^{206}\text{Pb} + \alpha$
- Events selection:
 - ➔ Multiplicity 2, single event energy spectrum
 - ➔ Cut on total energy to select the ^{210}Po α decay

^{210}Po alpha decay (nominal values)

- $E(\alpha) = 5304.38 \text{ keV}$
- $E(\text{recoil}) = 103.08 \text{ keV}$
- $E_{\text{tot}} = 5407.46 \text{ keV}$

Alpha contributions: ^{210}Po

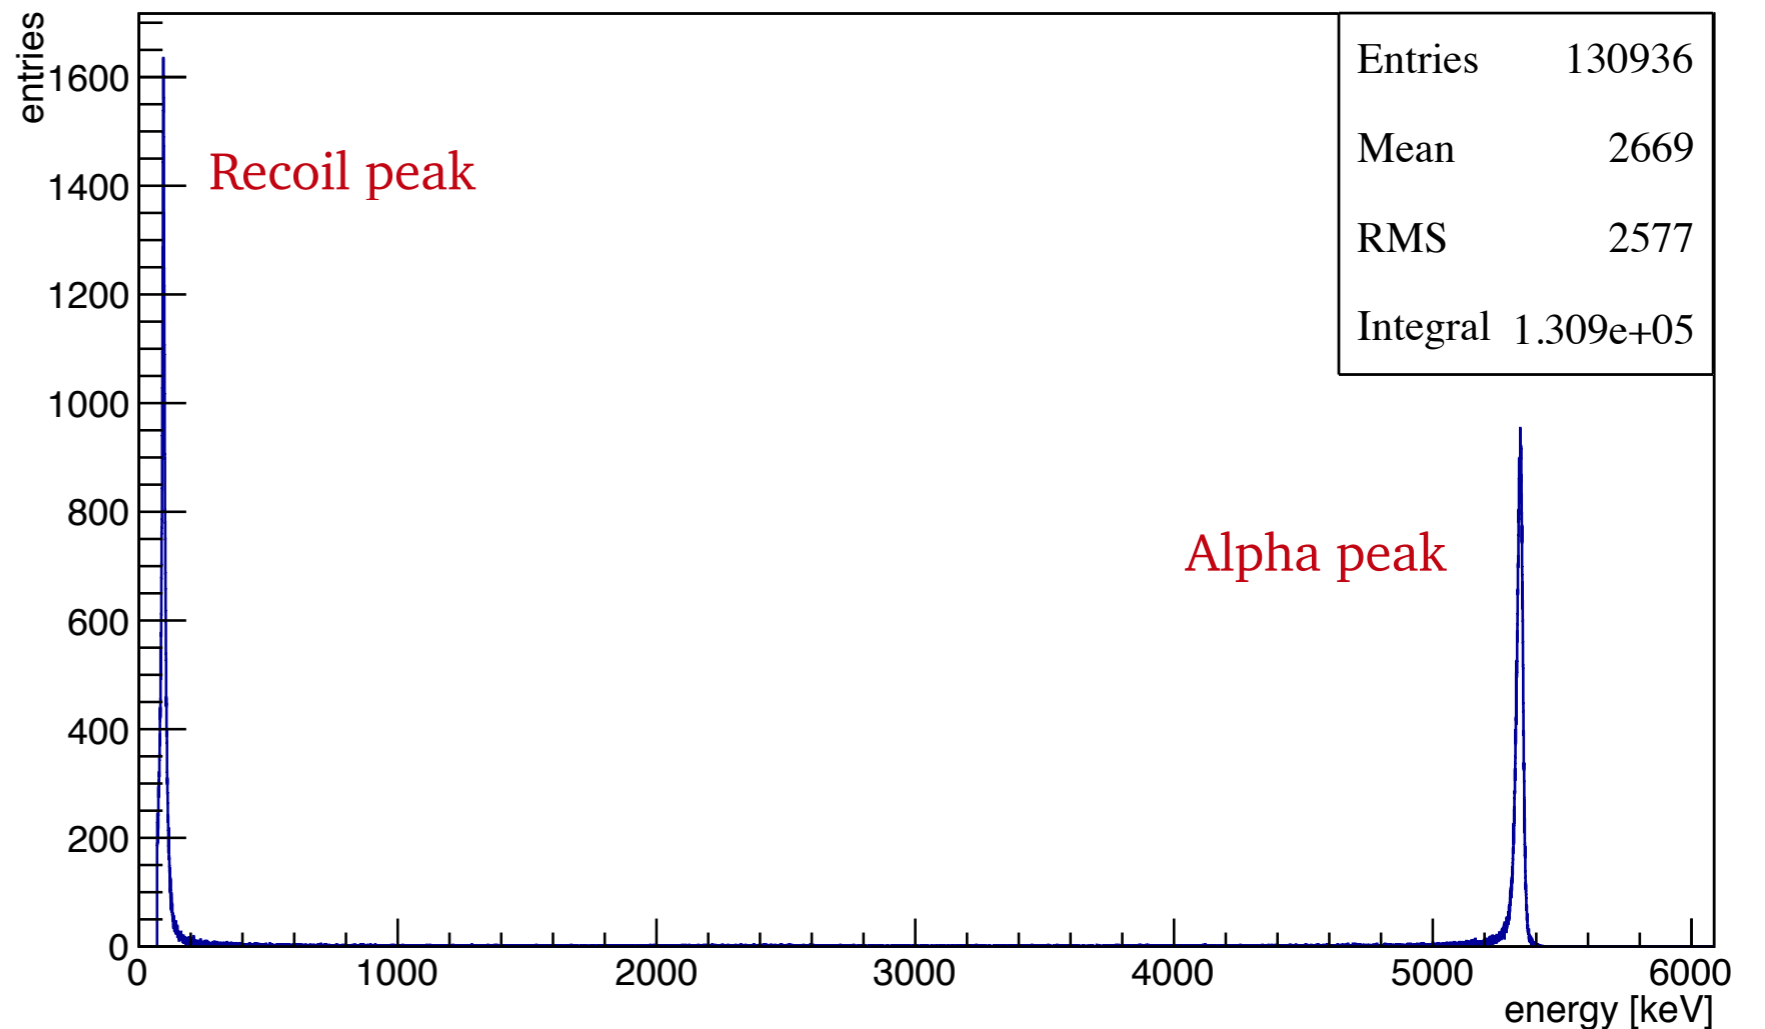

- $^{210}\text{Po} \rightarrow ^{206}\text{Pb} + \alpha$
- Events selection:
 - ➔ Multiplicity 2, single event energy spectrum
 - ➔ Cut on total energy to select the ^{210}Po α decay

^{210}Po alpha decay
(nominal values)

- $E(\alpha) = 5304.38 \text{ keV}$
- $E(\text{recoil}) = 103.08 \text{ keV}$
- $E_{\text{tot}} = 5407.46 \text{ keV}$

All ds spectrum M2 single energy - ^{210}Po

Alpha contributions: ^{210}Po

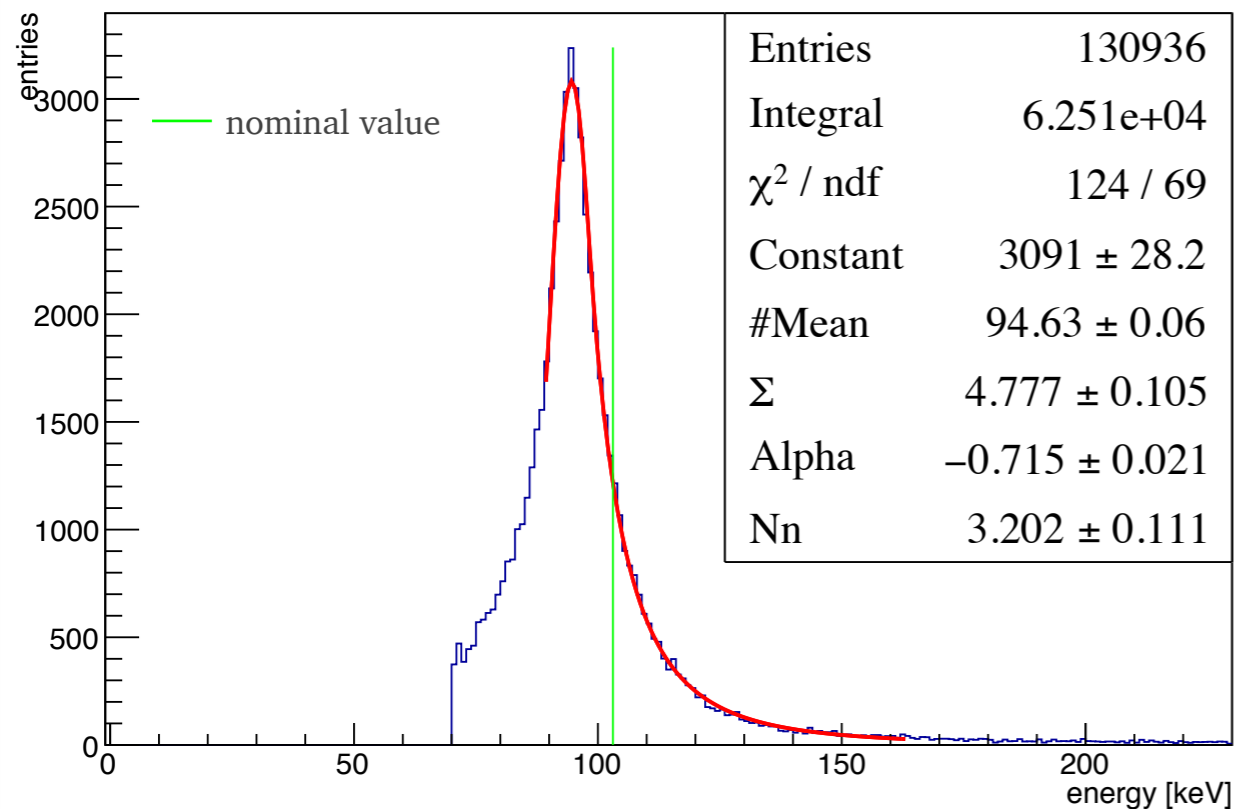

- $^{210}\text{Po} \rightarrow ^{206}\text{Pb} + \alpha$
- Events selection:
 - ➔ Multiplicity 2, single event energy spectrum
 - ➔ Cut on total energy to select the ^{210}Po α decay

^{210}Po alpha decay (nominal values)

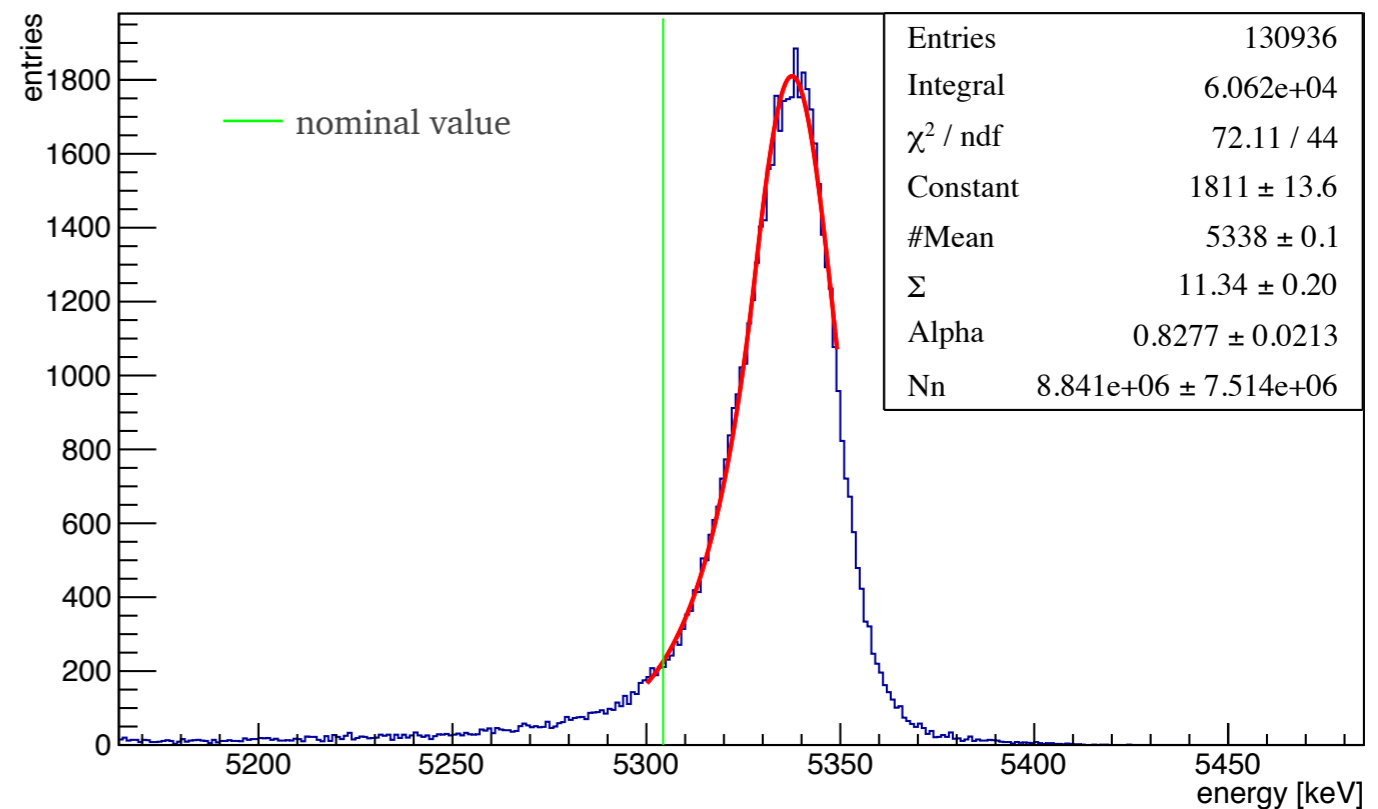

- $E(\alpha) = 5304.38$ keV
- $E(\text{recoil}) = 103.08$ keV
- $E_{\text{tot}} = 5407.46$ keV

All ds spectrum M2 single energy - ^{210}Po

All ds spectrum M2 single energy - ^{210}Po

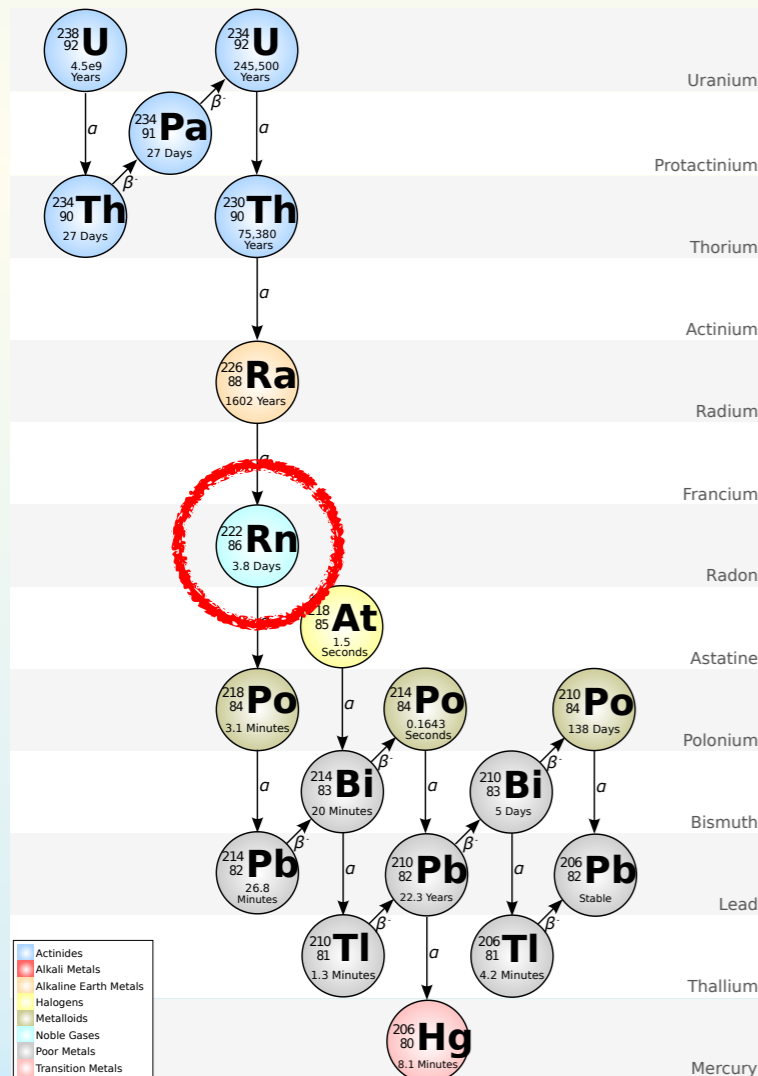

Alpha contributions: ^{222}Rn

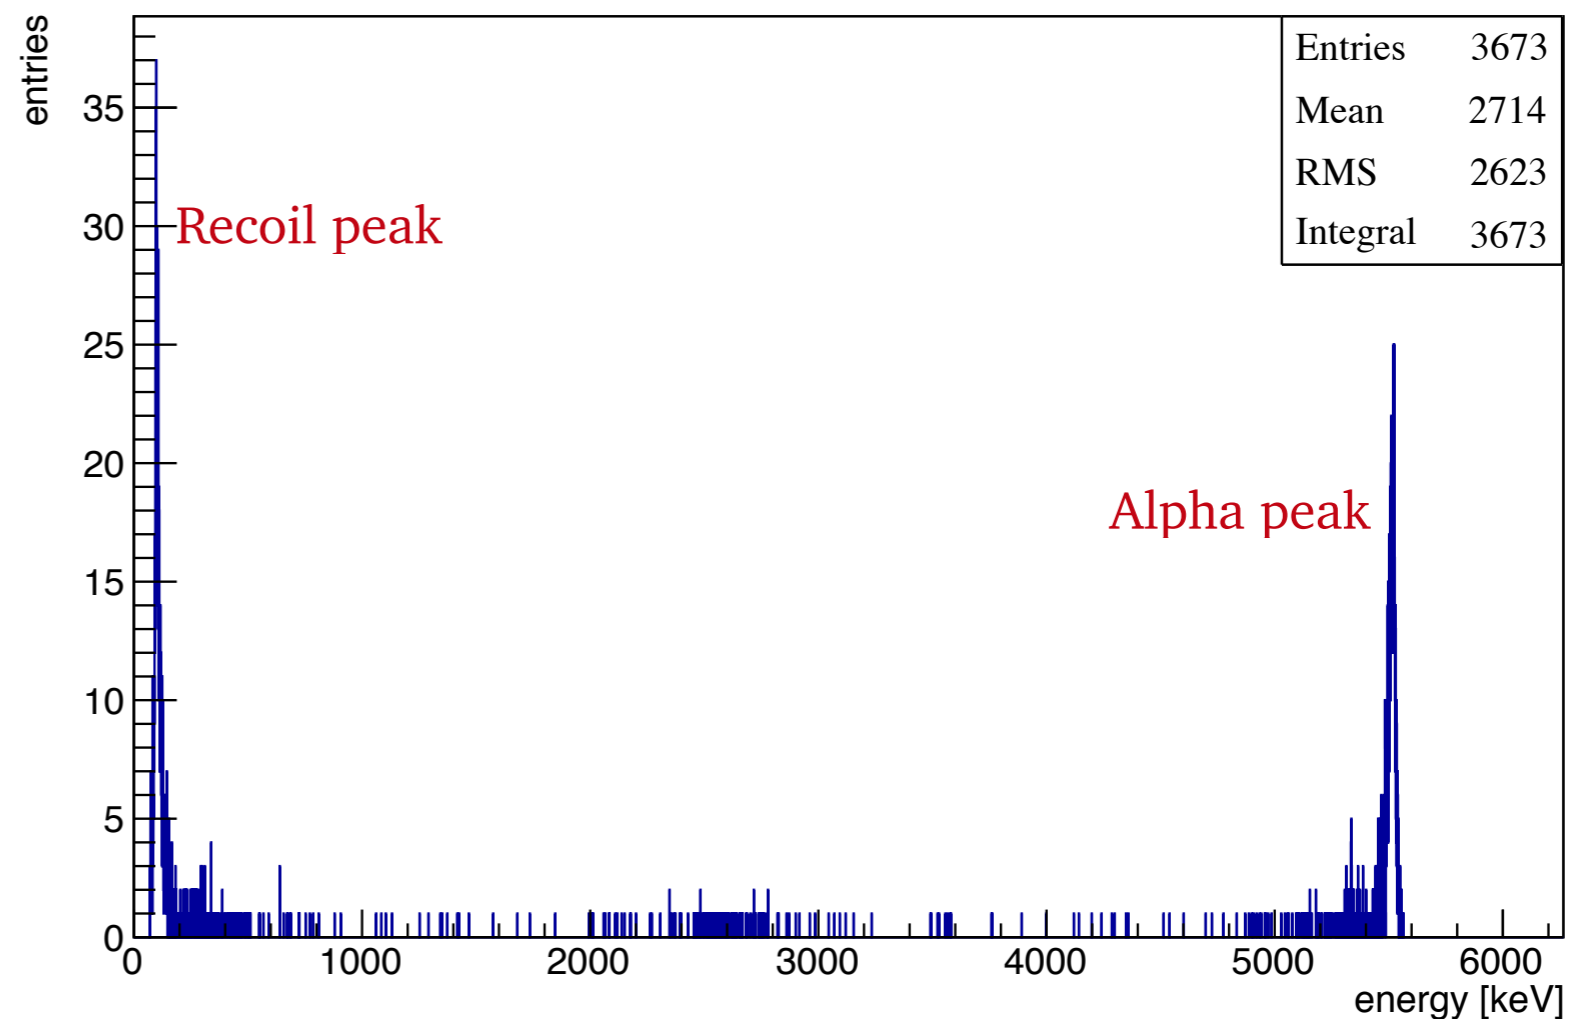

- $^{222}\text{Rn} \rightarrow ^{218}\text{Po} + \alpha$
- Events selection:
 - ➔ Multiplicity 2, single event energy spectrum
 - ➔ Cut on total energy to select the ^{222}Rn α decay

^{222}Rn alpha decay (nominal values)

- $E(\alpha) = 5489.52 \text{ keV}$
- $E(\text{recoil}) = 100.78 \text{ keV}$
- $E_{\text{tot}} = 5590.30 \text{ keV}$

All ds spectrum M2 single energy - ^{222}Rn

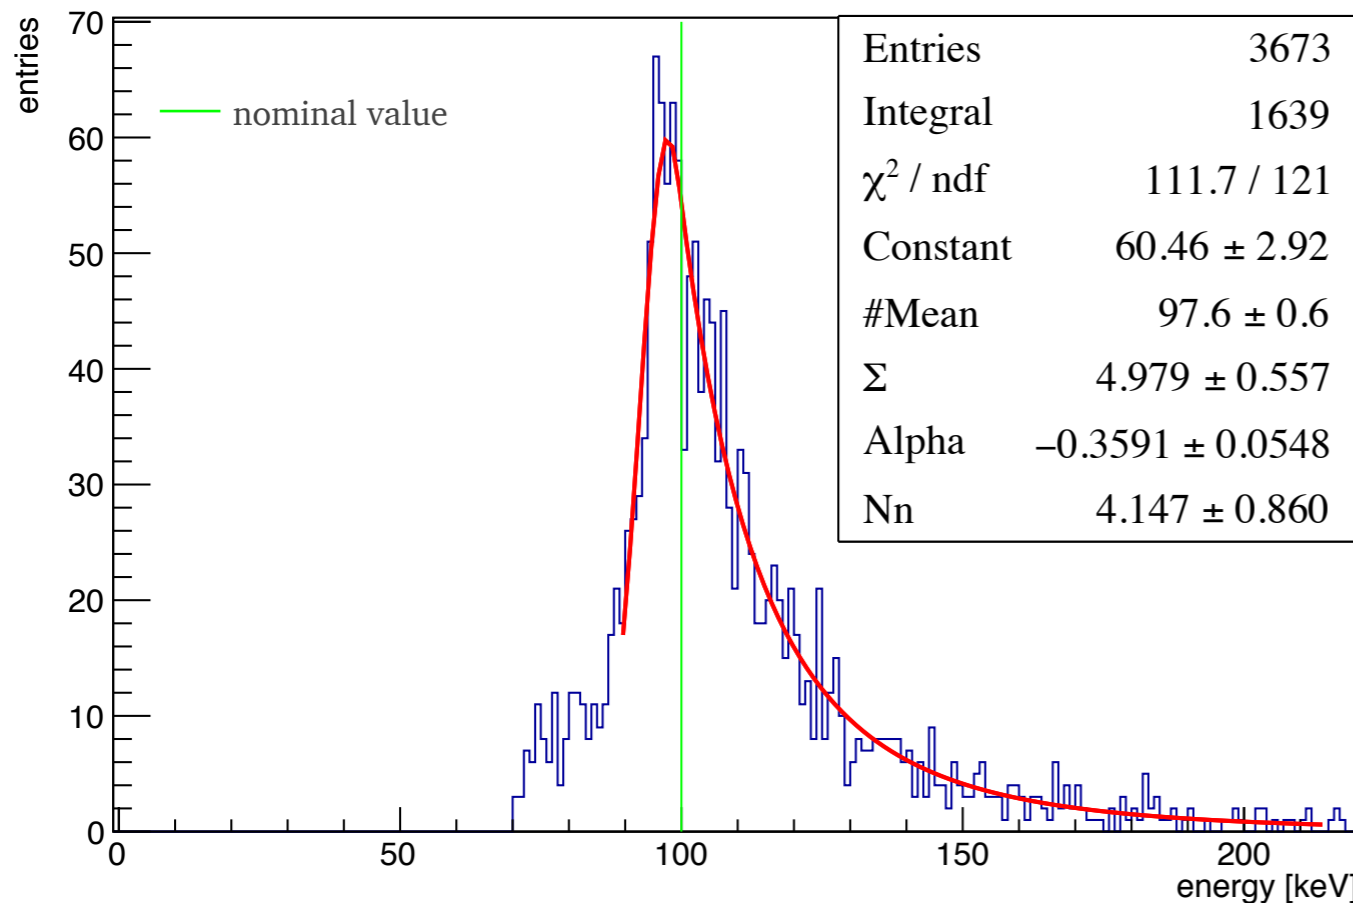

Alpha contributions: ^{222}Rn

- $^{222}\text{Rn} \rightarrow ^{218}\text{Po} + \alpha$
- Events selection:
 - ➔ Multiplicity 2, single event energy spectrum
 - ➔ Cut on total energy to select the ^{222}Rn α decay

^{222}Rn alpha decay (nominal values)

- $E(\alpha) = 5489.52 \text{ keV}$
- $E(\text{recoil}) = 100.78 \text{ keV}$
- $E_{\text{tot}} = 5590.30 \text{ keV}$

All ds spectrum M2 single energy - ^{222}Rn

All ds spectrum M2 single energy - ^{222}Rn

Alpha contributions

- Multiplicity 2, total energy spectrum (alpha+recoil)
- Zoom on Q_{value} peaks of ^{210}Po and ^{222}Rn alpha decay
- Green is nominal value, violet is the sum of reconstructed alpha and recoil peaks

All ds spectrum M2 total energy - ^{210}Po

All ds spectrum M2 total energy - ^{222}Rn

Fit results

	Fit results	Nominal values
^{210}Po - alpha:	(5338.0 ± 0.1) keV	5304.38 keV
^{222}Rn - alpha:	(5515.0 ± 0.8) keV	5489.52 keV
^{210}Po - recoil:	(94.63 ± 0.06) keV	103.08 keV
^{222}Rn - recoil:	(97.6 ± 0.6) keV	100.78 keV

QUENCHING FACTOR (q)

An α particle interacting with TeO_2 crystals generates a signal that is higher than expected

$$\frac{E_{ee}}{E_{nominal}} \equiv q$$

	Fit results	Reconstructed alpha+recoil	Nominal values
^{210}Po :	(5431.0 ± 0.1) keV	(5432.6 ± 0.1) keV	5407.46 keV
^{222}Rn :	(5616.0 ± 0.3) keV	(5613 ± 1) keV	5490.30 keV

- Alpha peaks: $(E_{meas}/E_{nom})_{\text{Po}} = 1.006$
 $(E_{meas}/E_{nom})_{\text{Rn}} = 1.005$

In CUORE-0 we had $q=1.007$; we don't expect a great difference in CUORE, this will be better quantified by studying all the possible alpha peaks

Fit results

	Fit results	Nominal values
^{210}Po - alpha:	(5338.0 ± 0.1) keV	5304.38 keV
^{222}Rn - alpha:	(5515.0 ± 0.8) keV	5489.52 keV
^{210}Po - recoil:	(94.63 ± 0.06) keV	103.08 keV
^{222}Rn - recoil:	(97.6 ± 0.6) keV	100.78 keV

QUENCHING FACTOR (q)

An α particle interacting with TeO_2 crystals generates a signal that is higher than expected

$$\frac{E_{ee}}{E_{nominal}} \equiv q$$

	Fit results	Reconstructed alpha+recoil	Nominal values
^{210}Po :	(5431.0 ± 0.1) keV	(5432.6 ± 0.1) keV	5407.46 keV
^{222}Rn :	(5616.0 ± 0.3) keV	(5613 ± 1) keV	5490.30 keV

- **Alpha peaks:** $(E_{\text{meas}}/E_{\text{nom}})_{\text{Po}} = 1.006$
 $(E_{\text{meas}}/E_{\text{nom}})_{\text{Rn}} = 1.005$

In CUORE-0 we had $q=1.007$; we don't expect a great difference in CUORE, this will be better quantified by studying all the possible alpha peaks

- **Recoil peaks:** evidence of a ~ 8 keV shift to lower energy for ^{210}Po recoil peak, ~ 3 keV for the ^{222}Rn one
(Different depth of the two contaminations? Not-ideal crystal response to surface contaminations?)

Fit results

	Fit results	Nominal values
^{210}Po - alpha:	(5338.0 ± 0.1) keV	5304.38 keV
^{222}Rn - alpha:	(5515.0 ± 0.8) keV	5489.52 keV
^{210}Po - recoil:	(94.63 ± 0.06) keV	103.08 keV
^{222}Rn - recoil:	(97.6 ± 0.6) keV	100.78 keV

QUENCHING FACTOR (q)
 An α particle interacting with TeO_2 crystals generates a signal that is higher than expected

$$\frac{E_{ee}}{E_{nominal}} \equiv q$$

	Fit results	Reconstructed alpha+recoil	Nominal values
^{210}Po :	(5431.0 ± 0.1) keV	(5432.6 ± 0.1) keV	5407.46 keV
^{222}Rn :	(5616.0 ± 0.3) keV	(5613 ± 1) keV	5490.30 keV

- Alpha peaks:** $(E_{meas}/E_{nom})_{Po} = 1.006$
 $(E_{meas}/E_{nom})_{Rn} = 1.005$
→
 In CUORE-0 we had $q=1.007$; we don't expect a great difference in CUORE, this will be better quantified by studying all the possible alpha peaks
- Recoil peaks:** evidence of a ~ 8 keV shift to lower energy for ^{210}Po recoil peak, ~ 3 keV for the ^{222}Rn one
(Different depth of the two contaminations? Not-ideal crystal response to surface contaminations?)
- Total energy peaks:** fit results and sum of reconstructed alpha and recoil should be the same
(Better fit model needed!)

Outlook

NEXT STEPS:

- More precise modeling of the peaks
- Include fit systematics
- Study of other alpha peaks and calculation of quenching factor in CUORE
- Study of other recoil peaks and investigation of shifts origin
- Study of contaminations rate vs time, positions, ...
